

Hacking Wireless Networks

Module 14

Unmask the Invisible Hacker.

Are You Protected from Hackers on Public Wi-Fi?

CEH
Certified Ethical Hacker

39% of U.S public Wi-Fi users have accessed sensitive information while using it

In what way have people accessed sensitive data when using free public Wi-Fi?

- 26% checked a bank account
- 19% paid a bill
- 8% sent email with sensitive data such as a social security number
- 6% filed taxes

66% of U.S adults have used public Wi-Fi

What potential issues with using public Wi-Fi do people recognize?

- 88% identity theft
- 76% compromised accounts
- 39% fraudulent tax filing

<http://www.socialmediatoday.com>

Wi-Fi Statistics

Globally, **46 percent of total mobile data traffic** was offloaded onto the fixed network through Wi-Fi

By 2018, **40 percent** of enterprises will specify Wi-Fi as the default connection for non mobile devices, such as desktops, desk phones, projectors, conference room.

Wireless Terminologies

GSM

Universal system used for mobile transportation for wireless network worldwide

Bandwidth

Describes the amount of information that may be broadcasted over a connection

BSSID

The MAC address of an access point that has set up a Basic Service Set (BSS)

ISM band

A set of frequency for the international Industrial, Scientific, and Medical communities

Access Point

Used to connect wireless devices to a wireless network

Hotspot

Places where wireless network is available for public use

Association

The process of connecting a wireless device to an access point

Orthogonal Frequency-division Multiplexing (OFDM)

Method of encoding digital data on multiple carrier frequencies

Direct-sequence Spread Spectrum (DSSS)

Original data signal is multiplied with a pseudo random noise spreading code

Frequency-hopping Spread Spectrum (FHSS)

Method of transmitting radio signals by rapidly switching a carrier among many frequency channels

Wireless Networks

CEH
Certified Ethical Hacker

- 1 ► Wi-Fi refers to wireless local area networks (WLAN) based on **IEEE 802.11 standard**
- 2 ► It is a widely used technology for wireless communication across a **radio channel**
- 3 ► Devices such as a personal computer, video-game console, smartphone, etc. use Wi-Fi to connect to a **network resource** such as the Internet via a **wireless network access point**

Advantages

- Installation is fast and easy and eliminates wiring through **walls** and **ceilings**
- It is easier to **provide connectivity** in areas where it is difficult to lay cable
- Access to the network can be from anywhere within range of an **access point**
- **Public places** like airports, libraries, schools or even coffee shops offer you constant Internet connections using Wireless LAN

Disadvantages

- Security is a big issue and may **not meet expectations**
- As the number of computers on the network increases, the **bandwidth suffers**
- Wi-Fi enhancements can require new **wireless cards and/or access points**
- Some **electronic equipment** can interfere with the Wi-Fi networks

Wi-Fi Networks at Home and Public Places

CEH
Certified Ethical Hacker

- Wi-Fi networks at home allow you to be wherever you want with your laptop, iPad, or handheld device, and not have to make holes for or hide **Ethernet cables**

Wi-Fi at Home

- You can find **free/paid Wi-Fi access** available in coffee shops, shopping malls, bookstores, offices, airport terminals, schools, hotels, and other public places

Wi-Fi at Public Places

Wireless Technology Statistics

CEH
Certified Ethical Hacker

Why Wireless Technology Matters?

More than half of all open Wi-Fi networks are susceptible to abuse

There will be more than **7 billion** new Wi-Fi enabled devices in the next 3 years

90% of all smartphones are equipped with Wi-Fi capabilities

A Wi-Fi attack on an open network can take less than **2 seconds**

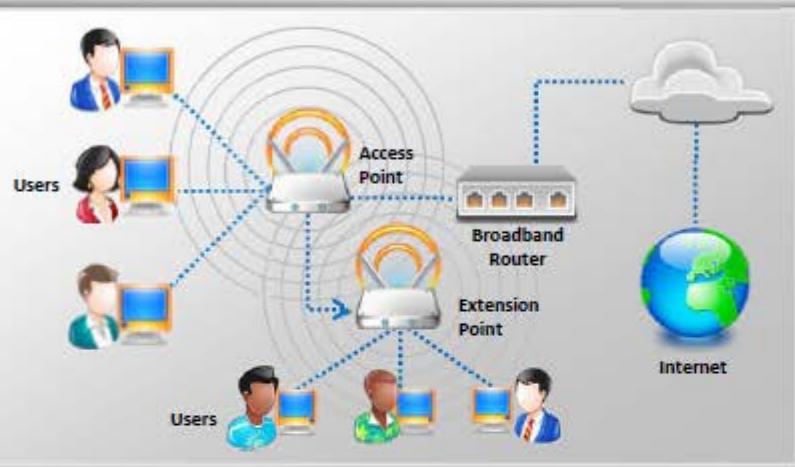

By 2017, **60%** of carrier network traffic will be offloaded to Wi-Fi

71% of all mobile communications flows over Wi-Fi

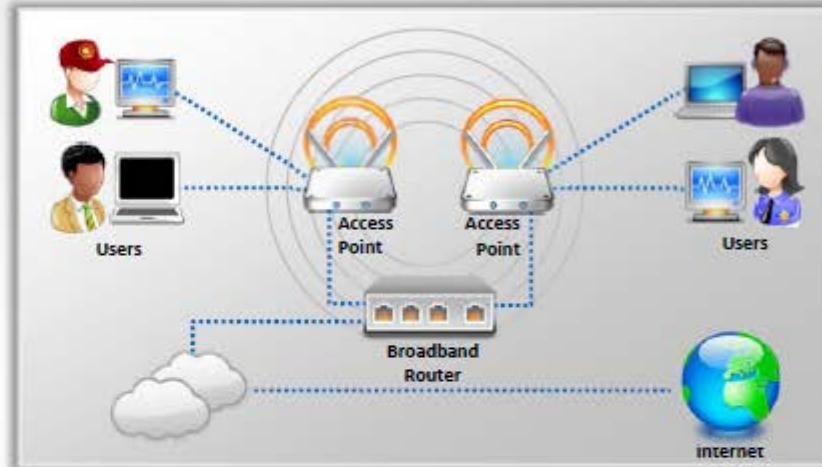

<http://www.huffingtonpost.com>

Types of Wireless Networks

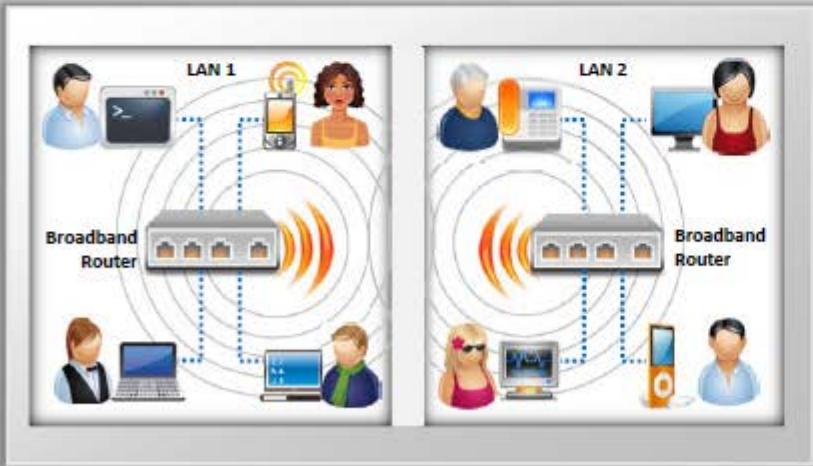

CEH
Certified Ethical Hacker

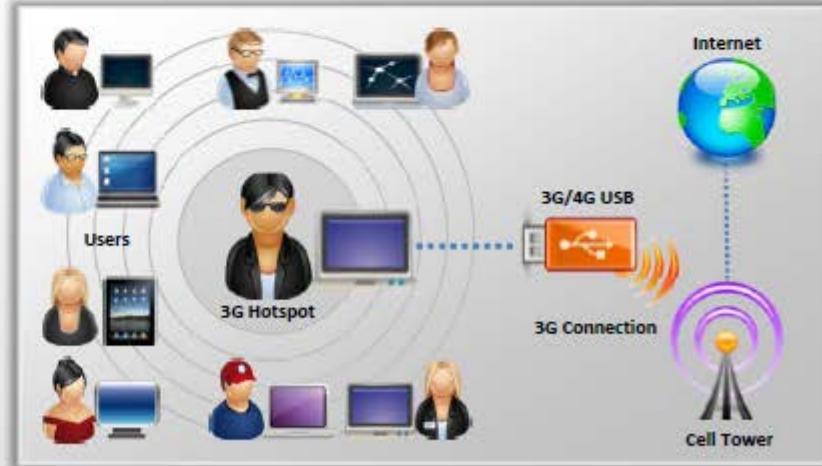

Extension to a Wired Network

Multiple Access Points

LAN-to-LAN Wireless Network

3G/4G Hotspot

Wireless Standards

Amendments	Freq. (GHz)	Modulation	Speed (Mbps)	Range (ft)
802.11a	5	OFDM	54	25 – 75
802.11b	2.4	DSSS	11	150 – 150
802.11g	2.4	OFDM, DSSS	54	150 – 150
802.11i	Defines WPA2-Enterprise/WPA2-Personal for Wi-Fi			
802.11n	2.4, 5	OFDM	54	~100
802.16 (WiMAX)	10 - 66		70 – 1000	30 miles
Bluetooth	2.4		1 - 3	25

Wi Fi

Service Set Identifier (SSID)

01

SSID is a token to **identify a 802.11 (Wi-Fi) network**; by default it is the part of the frame header sent over a wireless local area network (WLAN)

02

It acts as a **single shared identifier** between the access points and clients

03

Access points continuously broadcasts SSID, if enabled, for the client machines to identify the presence of wireless network

04

SSID is a human-readable text string with a maximum length of 32 bytes

05

If SSID of the network is changed, **reconfiguration of the SSID on every host** is required, as every user of the network configures the SSID into their system

06

A **non-secure access mode** allows clients to connect to the access point using the configured SSID, a blank SSID, or an SSID configured as "any"

07

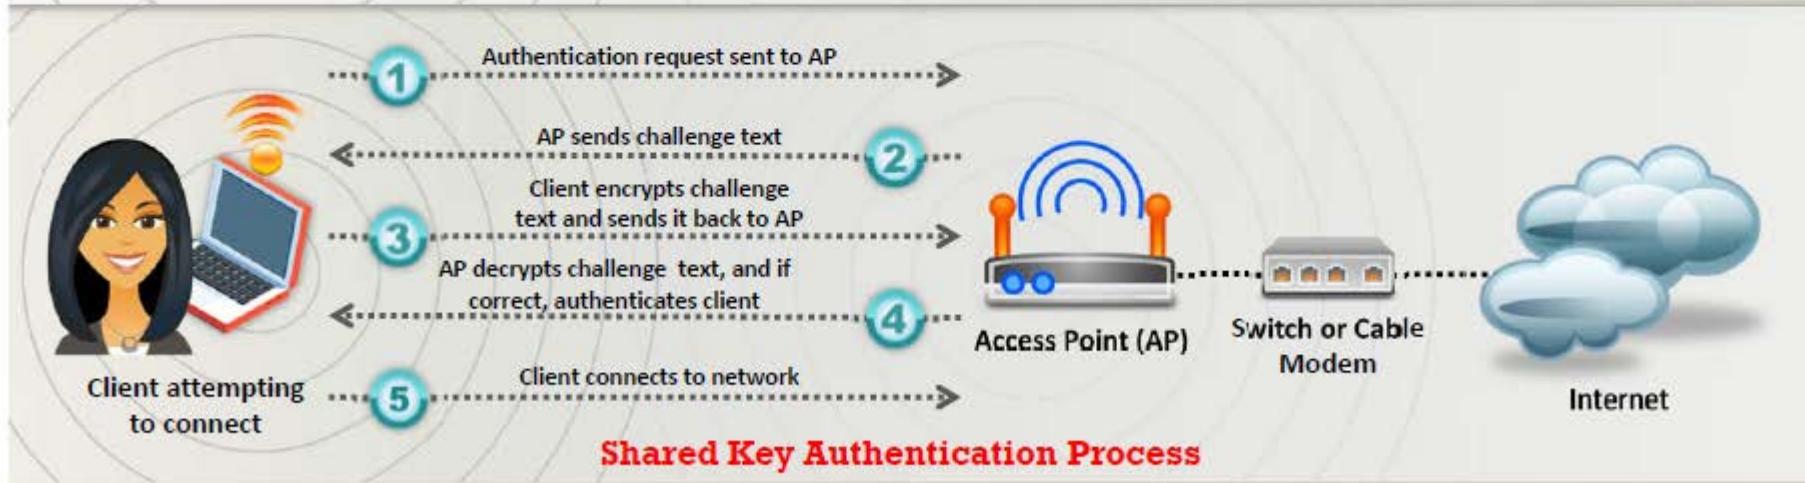

Security concerns arise when the default values are not changed, as these units can be compromised

08

The SSID **remains secret** only on the closed networks with no activity, that is inconvenient to the legitimate users

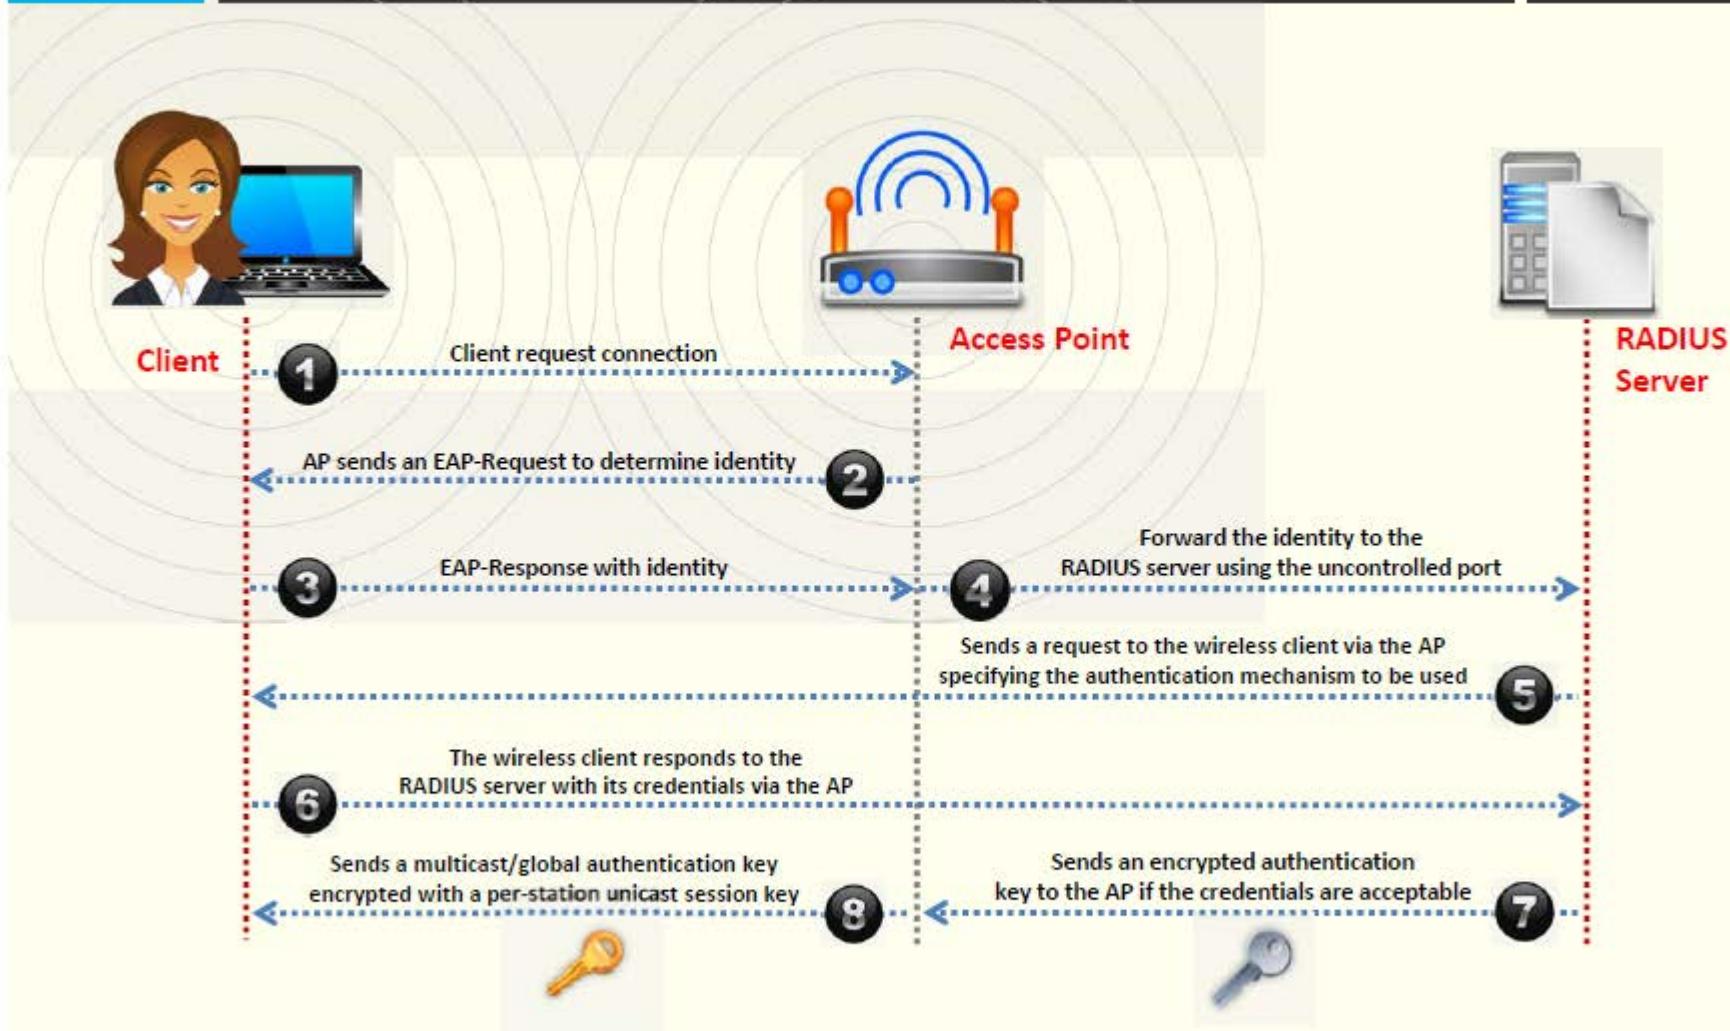

Wi-Fi Authentication Modes

CEH
Certified Ethical Hacker

Wi-Fi Authentication Process Using a Centralized Authentication Server

CEH
Certified Ethical Hacker

Wi-Fi Chalking

WarWalking

Attackers **walk around with Wi-Fi enabled laptops** to detect open wireless networks

WarChalking

A method used to **draw symbols in public places** to advertise open Wi-Fi networks

WarFlying

In this technique, attackers **use drones** to detect open wireless networks

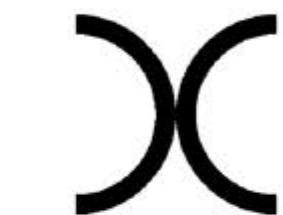

WarDriving

Attackers **drive around with Wi-Fi enabled laptops** to detect open wireless networks

Wi-Fi Chalking Symbols

Pay for Wi-Fi

Wi-Fi with WEP

Wi-Fi with Multiple Access Controls

Wi-Fi with Closed SSID

Wi-Fi Honeypot

Types of Wireless Antennas

CEH
Certified Ethical Hacker

Directional Antenna

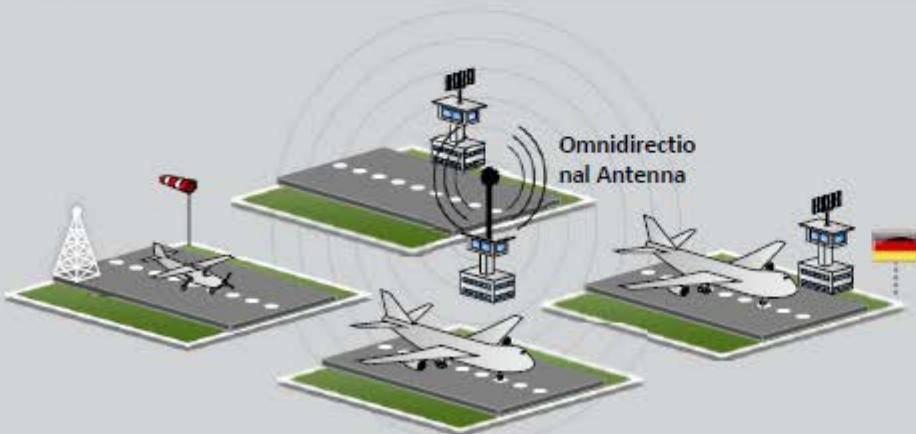

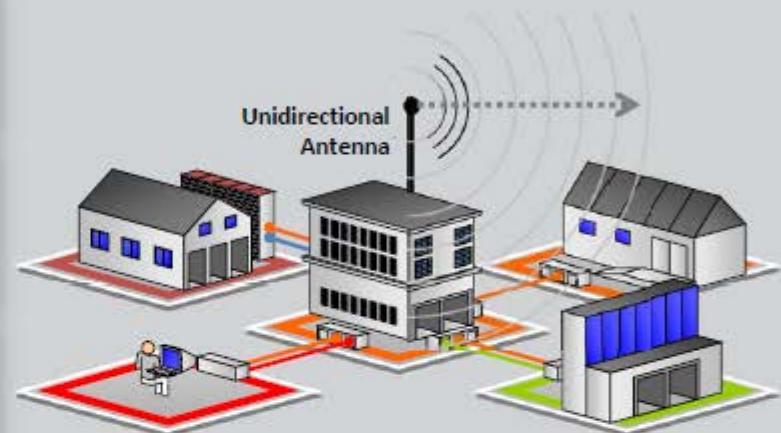

Used to broadcast and obtain radio waves from a single direction

Omnidirectional Antenna

It provides a 360 degree horizontal radiation pattern. It is used in wireless base stations.

Parabolic Grid Antenna

It is based on the principle of a satellite dish but it does not have a solid backing. They can pick up Wi-Fi signals ten miles or more.

Yagi Antenna

Yagi is a unidirectional antenna commonly used in communications for a frequency band of 10 MHz to VHF and UHF

Dipole Antenna

Bidirectional antenna, used to support client connections rather than site-to-site applications

Parabolic Grid Antenna

CEH
Certified Ethical Hacker

Parabolic grid antennas enable attackers to get **better signal quality** resulting in more data to eavesdrop on, **more bandwidth** to abuse and **higher power output** that is essential in Layer 1 DoS and man-in-the-middle attacks

Grid parabolic antennas can pick up Wi-Fi signals from a distance of **ten miles**

SSID	Channel	Encryption	Authentication	Signal
Apple	2	None	Unknown	24%
My Wi-Fi	5	WEP	Unknown	40%
GSM	1	WEP	Unknown	64%
Wi-Fi Planet	6	None	Unknown	38%
Awslocal	8	None	Unknown	54%

Wi-Fi Pen Testing

Types of Wireless Encryption

WPA2

WPA2 uses AES (128 bit) and CCMP for wireless data encryption

EAP

Supports multiple authentication methods, such as token cards, Kerberos, certificates etc.

802.11i

It is an IEEE amendment that specifies security mechanisms for 802.11 wireless networks

RADIUS

It is a centralized authentication and authorization management system

WPA2 Enterprise

It integrates EAP standards with WPA2 encryption

WEP

- WEP is an encryption algorithm for IEEE 802.11 wireless networks
- It is an old and original wireless security standard which can be cracked easily

TKIP

A security protocol used in WPA as a replacement for WEP

CCMP

CCMP utilizes 128-bit keys, with a 48-bit initialization vector (IV) for replay detection

AES

It is a symmetric-key encryption, used in WPA2 as a replacement of TKIP

WPA

- It is an advanced wireless encryption protocol using TKIP, MIC, and AES encryption
- Uses a 48 bit IV, 32 bit CRC and TKIP encryption for wireless security

LEAP

It is a proprietary WLAN authentication protocol developed by Cisco

WEP Encryption

CEH
Certified Ethical Hacker

What is WEP?

- Wired Equivalent Privacy (WEP) is an IEEE 802.11 wireless protocol which provides security algorithms for data confidentiality during wireless transmissions
- WEP uses a **24-bit initialization vector (IV)** to form stream cipher RC4 for confidentiality, and the CRC-32 checksum for integrity of wireless transmission

WEP encryption
can be easily
cracked

64-bit WEP uses a 40-bit key

128-bit WEP uses a 104-bit key size

256-bit WEP uses 232-bit key size

It was developed without:

- Academic or public review
- Review from cryptologists

WEP Flaws

- It has significant vulnerabilities and design flaws

How WEP Works

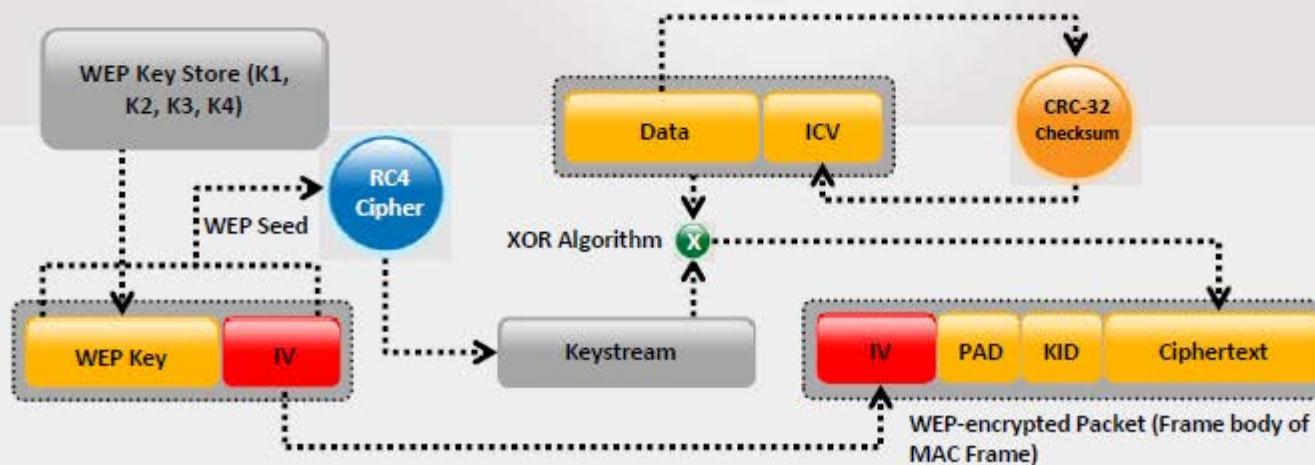

CEH
Certified Ethical Hacker

CRC-32 checksum is used to calculate a 32-bit **Integrity Check Value** (ICV) for the data, which, in turn, is added to the data frame

The WEP seed is used as the input to **RC4** algorithm to generate a key stream (key stream is bit-wise **XORed** with the combination of data and ICV to produce the encrypted data)

A 24-bit arbitrary number known as **Initialization Vector (IV)** is added to WEP key; WEP key and IV are together called as **WEP seed**

The IV field (IV+PAD+KID) is added to the ciphertext to generate a **MAC frame**

What is WPA?

CEH
Certified Ethical Hacker

- Wi-Fi Protected Access (WPA) is a **data encryption method** for WLANs based on 802.11 standards
- It is a snapshot of 802.11i (under development) providing **stronger encryption**, and enabling PSK or EAP authentication

TKIP (Temporal Key Integrity Protocol)

- TKIP utilizes the RC4 stream cipher encryption with **128-bit** keys and **64-bit** MIC integrity check
- TKIP mitigated vulnerability by **increasing the size of the IV** and using mixing functions

128-bit Temporal Key

- Under TKIP, the client starts with a 128-bit "temporal key" (TK) that is then **combined with the client's MAC address** and with an IV to create a keystream that is used to encrypt data via the RC4
- It implements a sequence counter to protect against **replay attacks**

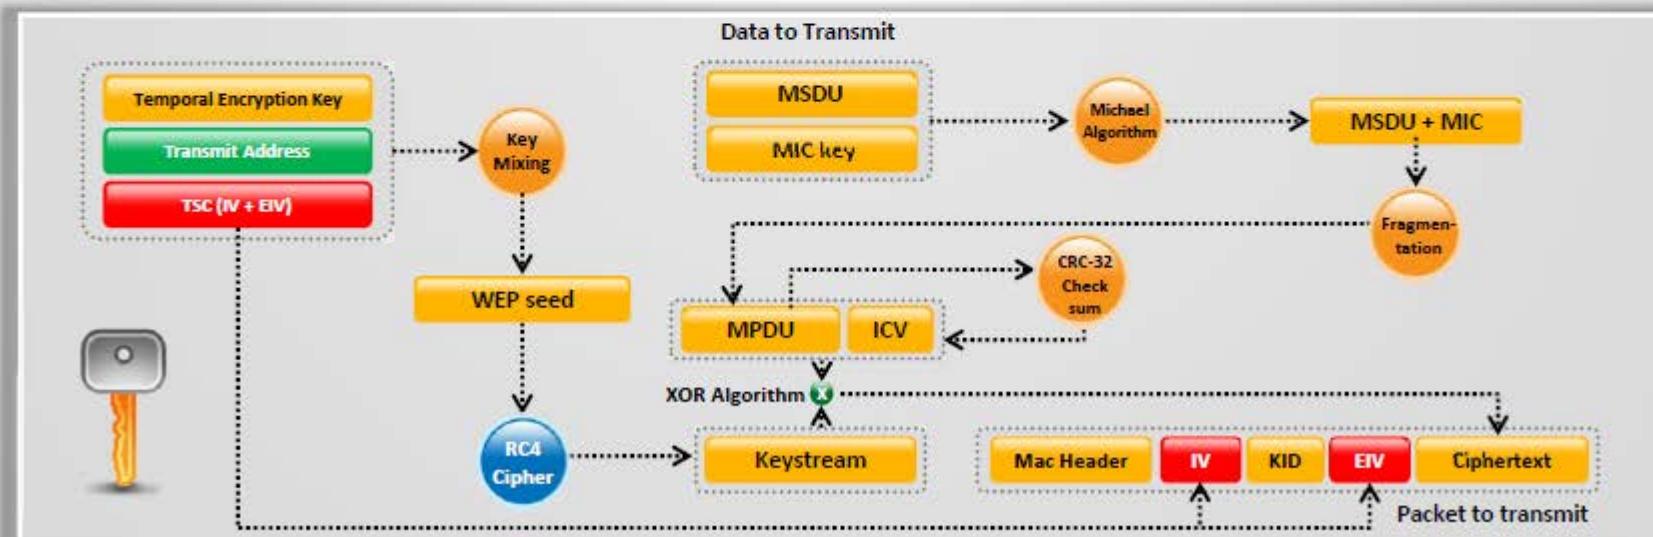

WPA Enhances WEP

- TKIP enhances WEP by adding a **rekeying mechanism** to provide fresh encryption and integrity keys
- Temporal keys are changed for every **10,000 packets**. This makes TKIP protected networks more resistant to cryptanalytic attacks involving key reuse

How WPA Works

CEH
Certified Ethical Hacker

- Temporal encryption key, transmit address, and TKIP sequence counter (TSC) is used as input to **RC4 algorithm** to generate a **Keystream**
- MAC Service Data Unit (MSDU) and message integrity check (MIC) are combined using **Michael algorithm**
- The combination of MSDU and MIC is fragmented to generate **MAC Protocol Data Unit (MPDU)**
- A **32-bit Integrity Check Value (ICV)** is calculated for the MPDU
- The combination of MPDU and ICV is bitwise **XORed with Keystream** to produce the encrypted data
- The **IV** is added to the encrypted data to generate **MAC frame**

Temporal Keys

- In WPA and WPA2, the encryption keys (temporal keys) are derived during the **four-way handshake**
- Encryption keys are derived from the PMK that is derived during the **EAP authentication session**
- In the **EAP success message**, PMK is sent to the AP but is not directed to the Wi-Fi client as it has derived its own copy of the PMK

01

AP sends an ANonce to client which uses it to construct the **Pairwise Transient Key (PTK)**

02

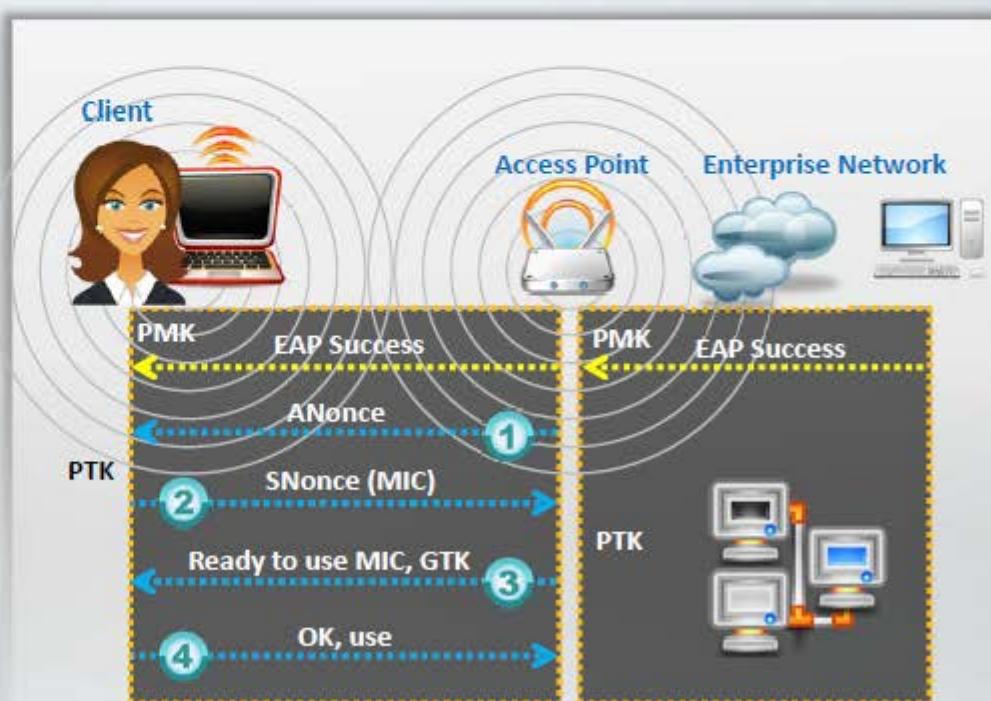

Client respond with its own nonce-value (SNonce) to the AP together with a **Message Integrity Code (MIC)**

03

AP sends the **GTK and a sequence number** together with another MIC which is used in the next broadcast frames

04

Client confirm that the temporal keys are installed

What is WPA2?

CEH
Certified Ethical Hacker

- WPA2 provides enterprise and Wi-Fi users with **stronger data protection** and **network access control**
- Provides government grade security by implementing the **National Institute of Standards and Technology** (NIST) **FIPS 140-2 compliant AES encryption** algorithm

WPA2-Personal

- WPA2-Personal uses a set-up password (**Pre-shared Key**, PSK) to protect unauthorized network access
- In PSK mode each wireless network device encrypts the network traffic using a 128-bit key that is derived from a passphrase of 8 to 63 ASCII characters

WPA2-Enterprise

- It includes **EAP** or **RADIUS** for centralized client authentication using multiple authentication methods, such as token cards, Kerberos, certificates etc.
- Users are assigned **login credentials** by a centralized server which they must present when connecting to the network

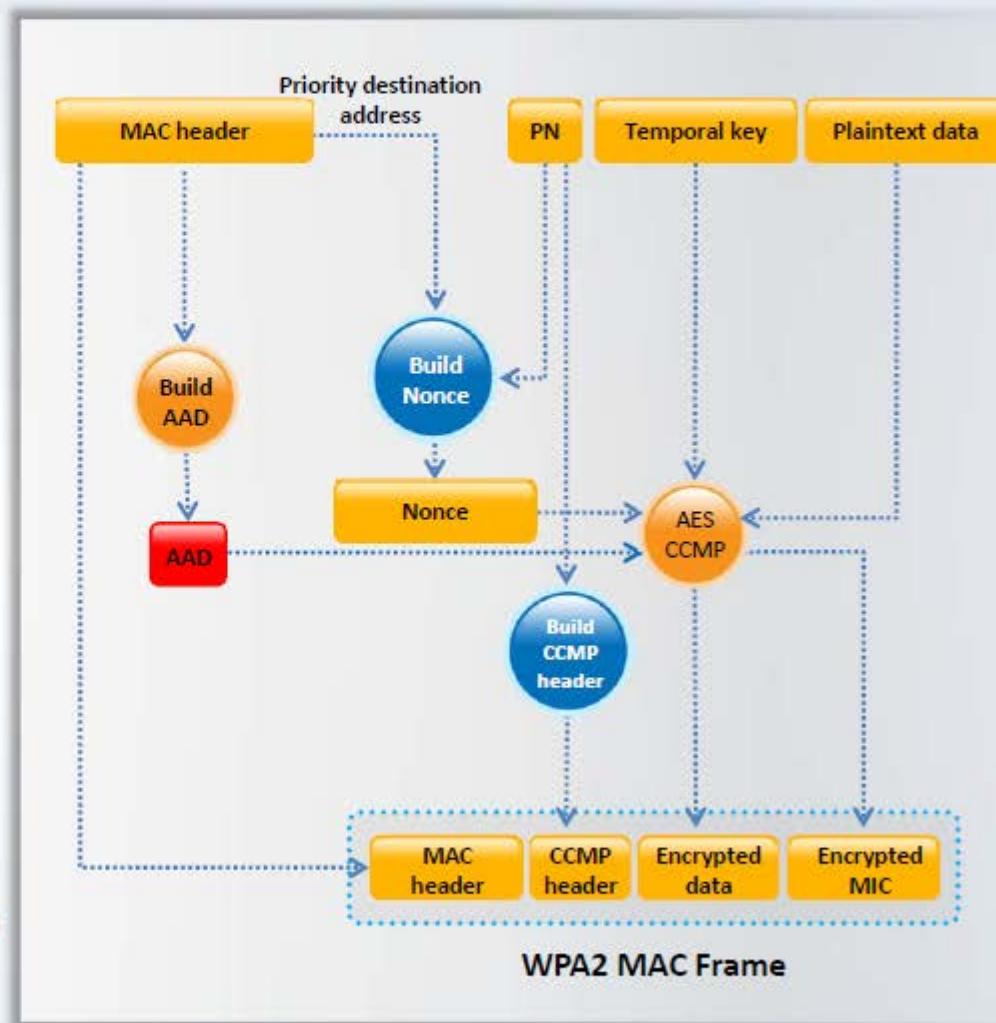

How WPA2 Works

In the CCMP implementation of WPA2, **MAC header data** is used to build additional authentication data (AAD)

A sequenced **packet number (PN)** is used to build nonce

AAD, temporal key and nonce along with CCMP are used for data encryption

A **WPA2 MAC Frame** is build using MAC header, CCMP header, encrypted data and encrypted MIC

WEP vs. WPA vs. WPA2

CEH
Certified Ethical Hacker

Encryption	Attributes			
	Encryption Algorithm	IV Size	Encryption Key Length	Integrity Check Mechanism
WEP	RC4	24-bits	40/104-bit	CRC-32
WPA	RC4, TKIP	48-bit	128-bit	Michael algorithm and CRC-32
WPA2	AES-CCMP	48-bit	128-bit	CBC-MAC

Should be replaced with more secure WPA and WPA2

Incorporates protection against forgery and replay attacks

WEP Issues

- 1 The IV is a 24-bit field is too small and is sent in the **cleartext** portion of a message
- 2 **Identical key streams** are produced with the reuse of the same IV for data protection, as the IV is short key streams are repeated within short time
- 3 **Lack of centralized key management** makes it difficult to change the WEP keys with any regularity
- 4 When there is IV Collision, it becomes possible to **reconstruct the RC4 keystream** based on the IV and the decrypted payload of the packet
- 5 IV is a part of the RC4 encryption key, leads to a **analytical attack** that recovers the key after intercepting and analyzing a relatively small amount of traffic
- 6 Use of RC4 was designed to be a **one-time cipher** and not intended for multiple message use
- 7 No defined method for **encryption key distribution**
- 8 Wireless adapters from the same vendor may all **generate the same IV sequence**. This enables attackers to determine the key stream and decrypt the ciphertext
- 9 Associate and disassociate messages are **not authenticated**
- 10 WEP does not provide cryptographic integrity protection. By capturing two packets an attacker can flip a bit in the encrypted stream and **modify the checksum** so that the packet is accepted
- 11 WEP is based on a password, prone to **password cracking attacks**
- 12 An attacker can construct a decryption table of the **reconstructed key stream** and can use it to decrypt the WEP Packets in real-time

Weak Initialization Vectors (IV)

1

In the RC4 algorithm, the **Key Scheduling Algorithm (KSA)** creates an IV based on the base key

2

The IV value is **too short and not protected** from reuse and no protection again message replay

3

A flaw in the WEP implementation of RC4 allows "**weak**" **IVs** to be generated

4

The way the keystream is constructed from the IV makes it susceptible to **weak key attacks** (FMS attack)

Those weak IVs **reveal information** about the key bytes they were derived from

5

No effective detection of **message tampering** (message integrity)

6

An attacker will collect enough weak IVs to reveal bytes of the **base key**

7

It directly uses the **master key** and has no built-in provision to update the keys

8

How to Break WEP Encryption

CEH
Certified Ethical Hacker

Test the **injection capability** of the wireless device to the access point

Start Wi-Fi sniffing tool such as airodump-ng or Cain & Abel with a bssid filter to **collect unique IVs**

Run a cracking tool such as Cain & Abel or aircrack-ng to **extract encryption key** from the IVs

Start the wireless interface in **monitor mode** on the specific access point channel

Use a tool such as aireplay-ng to do a **fake authentication** with the access point

Start a Wi-Fi packet encryption tool such as aireplay-ng in ARP request replay mode to **inject packets**

How to Break WPA Encryption

01

WPA PSK

- WPA PSK uses a **user defined password** to initialize the TKIP, which is not crackable as it is a per-packet key but the keys can be brute-forced using dictionary attacks

03

De-authentication Attack

- Force the connected client to disconnect, then capture the re-connect and authentication packet using tools such as aireplay, you should be able to re-authenticate in a few seconds then **attempt to Dictionary Brute Force** the PMK

02

Offline Attack

- You only have to be near the AP for a matter of seconds in order to capture the **WPA/WPA2 authentication handshake**, by capturing the right type of packets, you can **crack WPA keys offline**

04

Brute-Force WPA Keys

- You can use tools such as **aircrack**, **aireplay**, **KisMac** to brute-force WPA Keys

How to Defend Against WPA Cracking

Passphrases

- The only way to crack WPA is to sniff the **password PMK** associated with the “handshake” authentication process, and if this password is extremely complicated, it will be **almost impossible to crack**

Passphrase Complexity

- Select a **random passphrase** that is not made up of dictionary words
- Select a complex passphrase of a **minimum of 20 characters** in length and change it at regular intervals

Client Settings

- Use WPA2 with **AES/CCMP encryption** only
- Properly set the client settings (e.g. validate the server, specify **server address**, don't prompt for new servers, etc.)

Additional Controls

- Use **virtual-private-network (VPN)** technology such as Remote Access VPN, Extranet VPN, Intranet VPN, etc.
- Implement a **Network Access Control (NAC)** or **Network Access Protection (NAP)** solution for additional control over end-user connectivity

Wireless Threats

Wireless Hacking Methodology

Wireless Hacking Tools

Bluetooth Hacking

Countermeasures

Wireless Security Tools

Wi-Fi Pen Testing

Wireless Threats: Access Control Attacks

Wireless access control attacks aims to penetrate a network by **evading WLAN access control measures**, such as AP MAC filters and Wi-Fi port access controls

1 War Driving

2 Rogue Access Points

3 MAC Spoofing

4 AP Misconfiguration

5 Ad Hoc Associations

6 Promiscuous Client

7 Client Mis-association

8 Unauthorized Association

Wireless Threats: Integrity Attacks

In integrity attacks, attackers **send forged control, management or data frames over a wireless network** to misdirect the wireless devices in order to perform another type of attack (e.g., DoS)

- | | |
|--------------------------------------|--|
| <p>1 Data Frame Injection</p> | <p>5 Data Replay</p> |
| <p>2 WEP Injection</p> | <p>6 Initialization Vector Replay Attacks</p> |
| <p>3 Bit-Flipping Attacks</p> | <p>7 RADIUS Replay</p> |
| <p>4 Extensible AP Replay</p> | <p>8 Wireless Network Viruses</p> |

Wireless Threats: Confidentiality Attacks

These attacks attempt to **intercept confidential information sent over wireless associations**, whether sent in the clear text or encrypted by Wi-Fi protocols

Eavesdropping

Honeypot Access Point

Traffic Analysis

Session Hijacking

Cracking WEP Key

Masquerading

Evil Twin AP

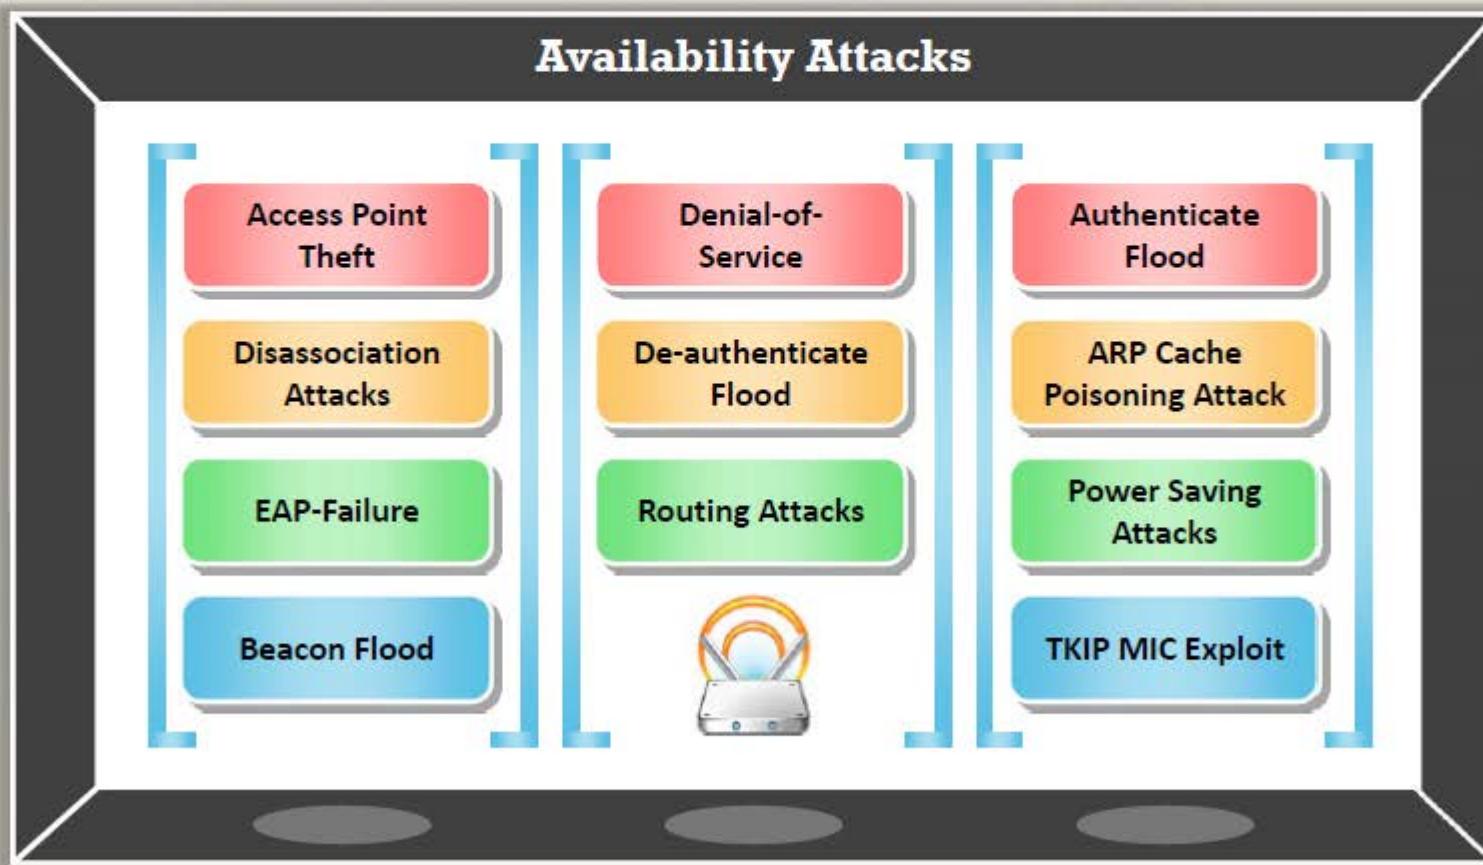

Man-in-the-Middle Attack

Wireless Threats: Availability Attacks

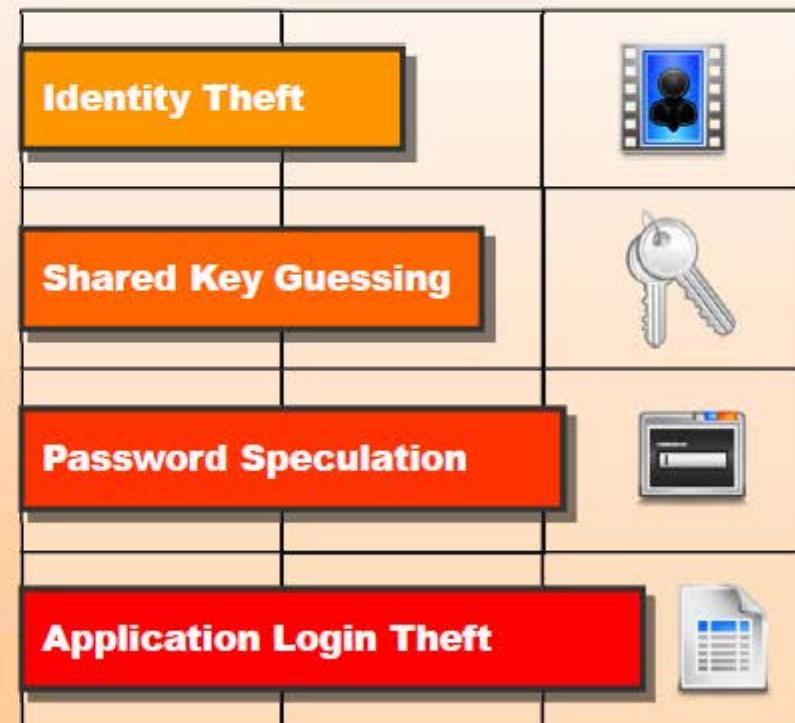

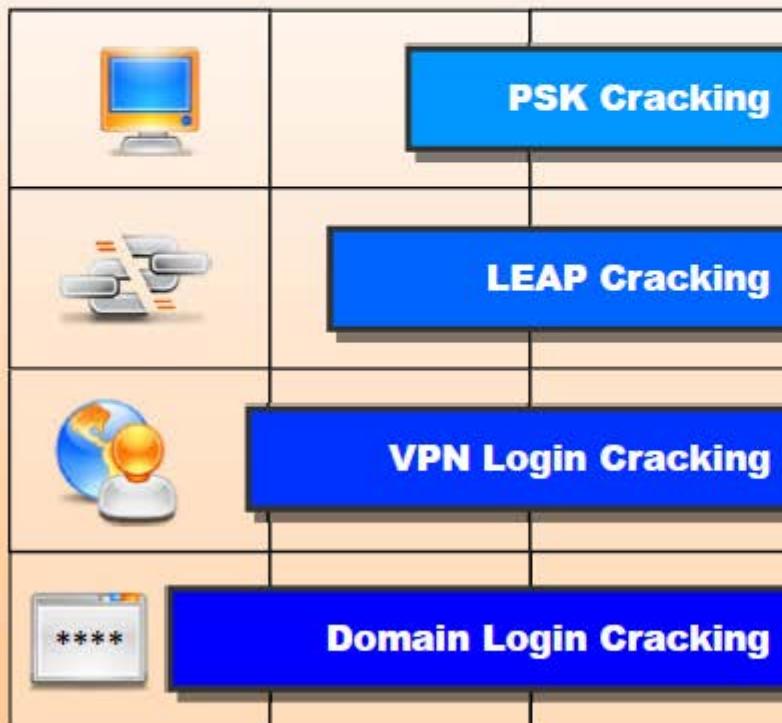

Denial-of-Service attacks aim to prevent **legitimate users from accessing resources** in a wireless network

Wireless Threats: Authentication Attacks

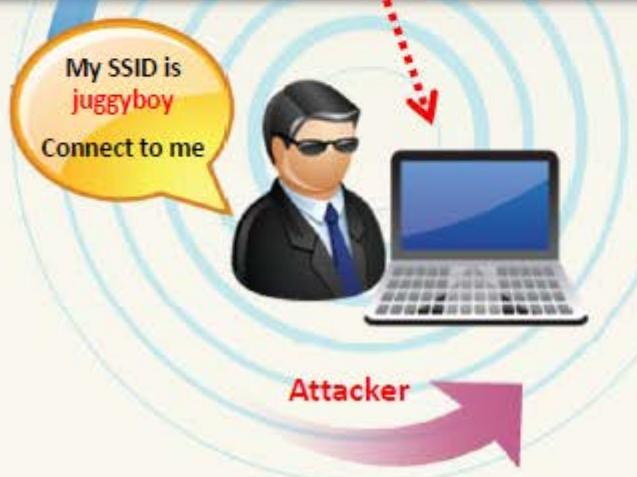

The objective of authentication attacks is to **steal the identity of Wi-Fi clients**, their personal information, login credentials, etc. to gain unauthorized access to network resources

Rogue Access Point Attack

CEH
Certified Ethical Hacker

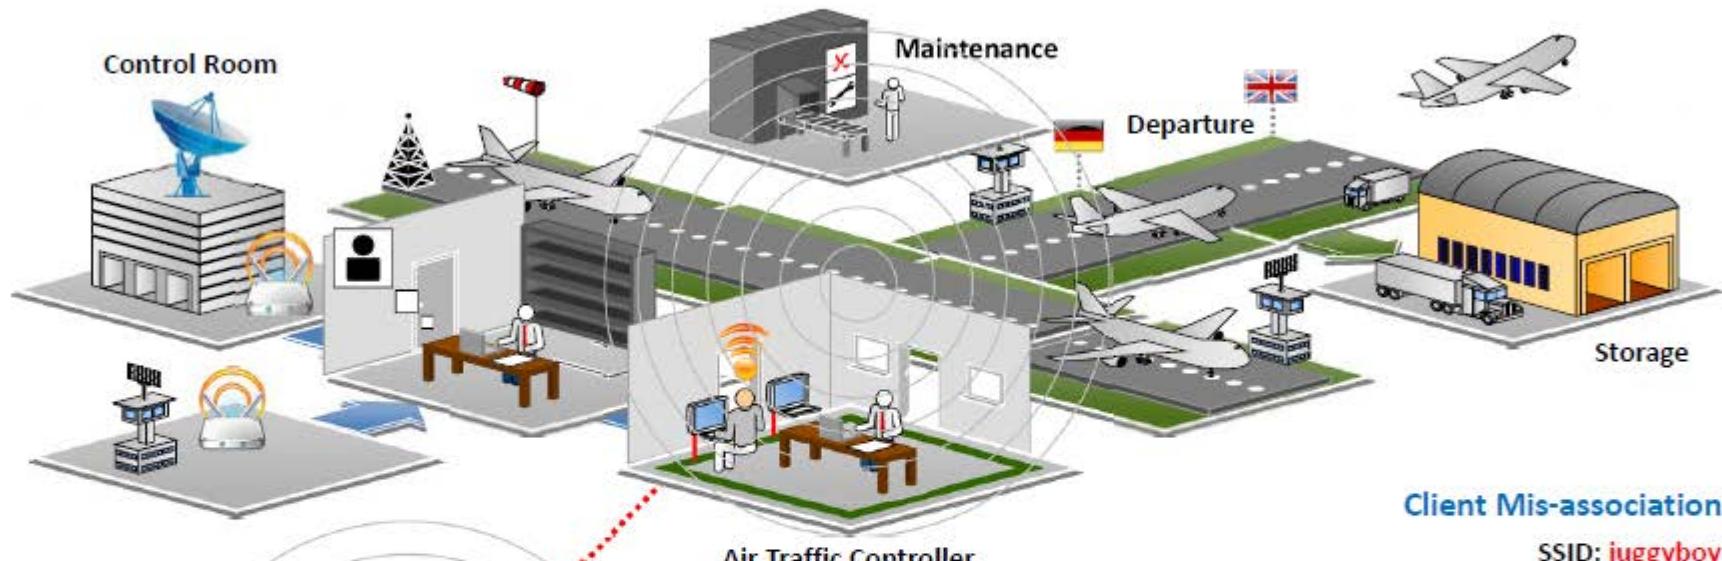

1
Rogue wireless access point placed into an 802.11 network can be used to **hijack the connections** of legitimate network users

2
When the user turns on the computer, the rogue wireless access point will offer to connect with the **network user's NIC**

3
All the traffic the user enters will pass through the rogue access point, thus enabling a form of **wireless packet sniffing**

Client Mis-association

CEH
Certified Ethical Hacker

- Attacker sets up a **rogue access point outside the corporate perimeter** and lures the employees of the organization to connect with it
- Once associated, employees may **bypass** the enterprise security policies

Misconfigured Access Point Attack

CEH
Certified Ethical Hacker

SSID Broadcast

Access points are configured to **broadcast SSIDs** to authorized users

Weak Password

To verify authorized users, network administrators **incorrectly use the SSIDs as passwords**

Configuration Error

SSID broadcasting is a configuration error that assists intruders to **steal an SSID** and have the AP assume they are allowed to connect

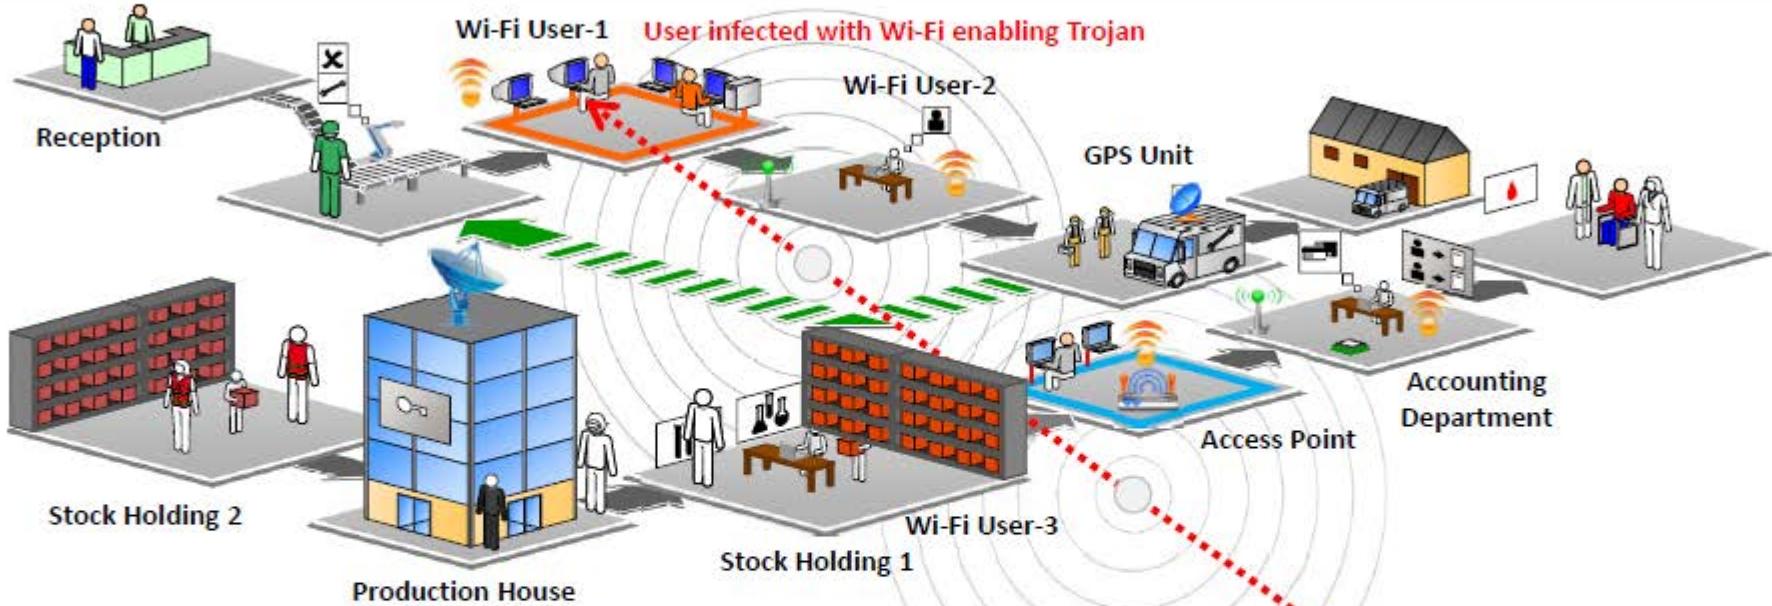

Connecting to **juggyboy**
No password,
Lucky Me!

Attacker

Unauthorized Association

CEH
Certified Ethical Hacker

01

Soft access points are client cards or embedded WLAN radios in some PDAs and laptops that can be launched **inadvertently or through a virus program**

02

Attackers infect victim's machine and activate soft APs allowing them **unauthorized connection** to the enterprise network

03

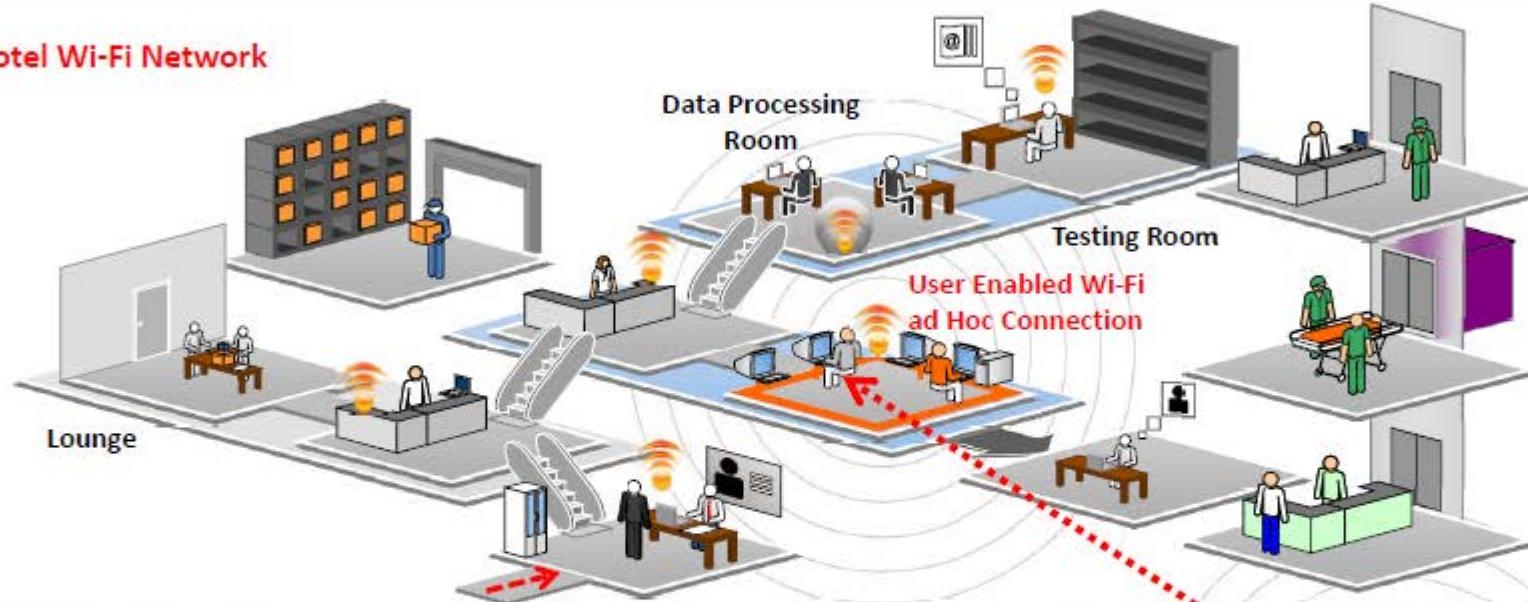

Attacker connect to enterprise network through **soft APs** instead of the actual Access Points

Ad Hoc Connection Attack

CEH
Certified Ethical Hacker

Hotel Wi-Fi Network

1

Wi-Fi clients communicate directly via **an ad hoc mode** that do not require an AP to relay packets

2

Ad hoc mode is inherently insecure and does not **provide strong authentication and encryption**

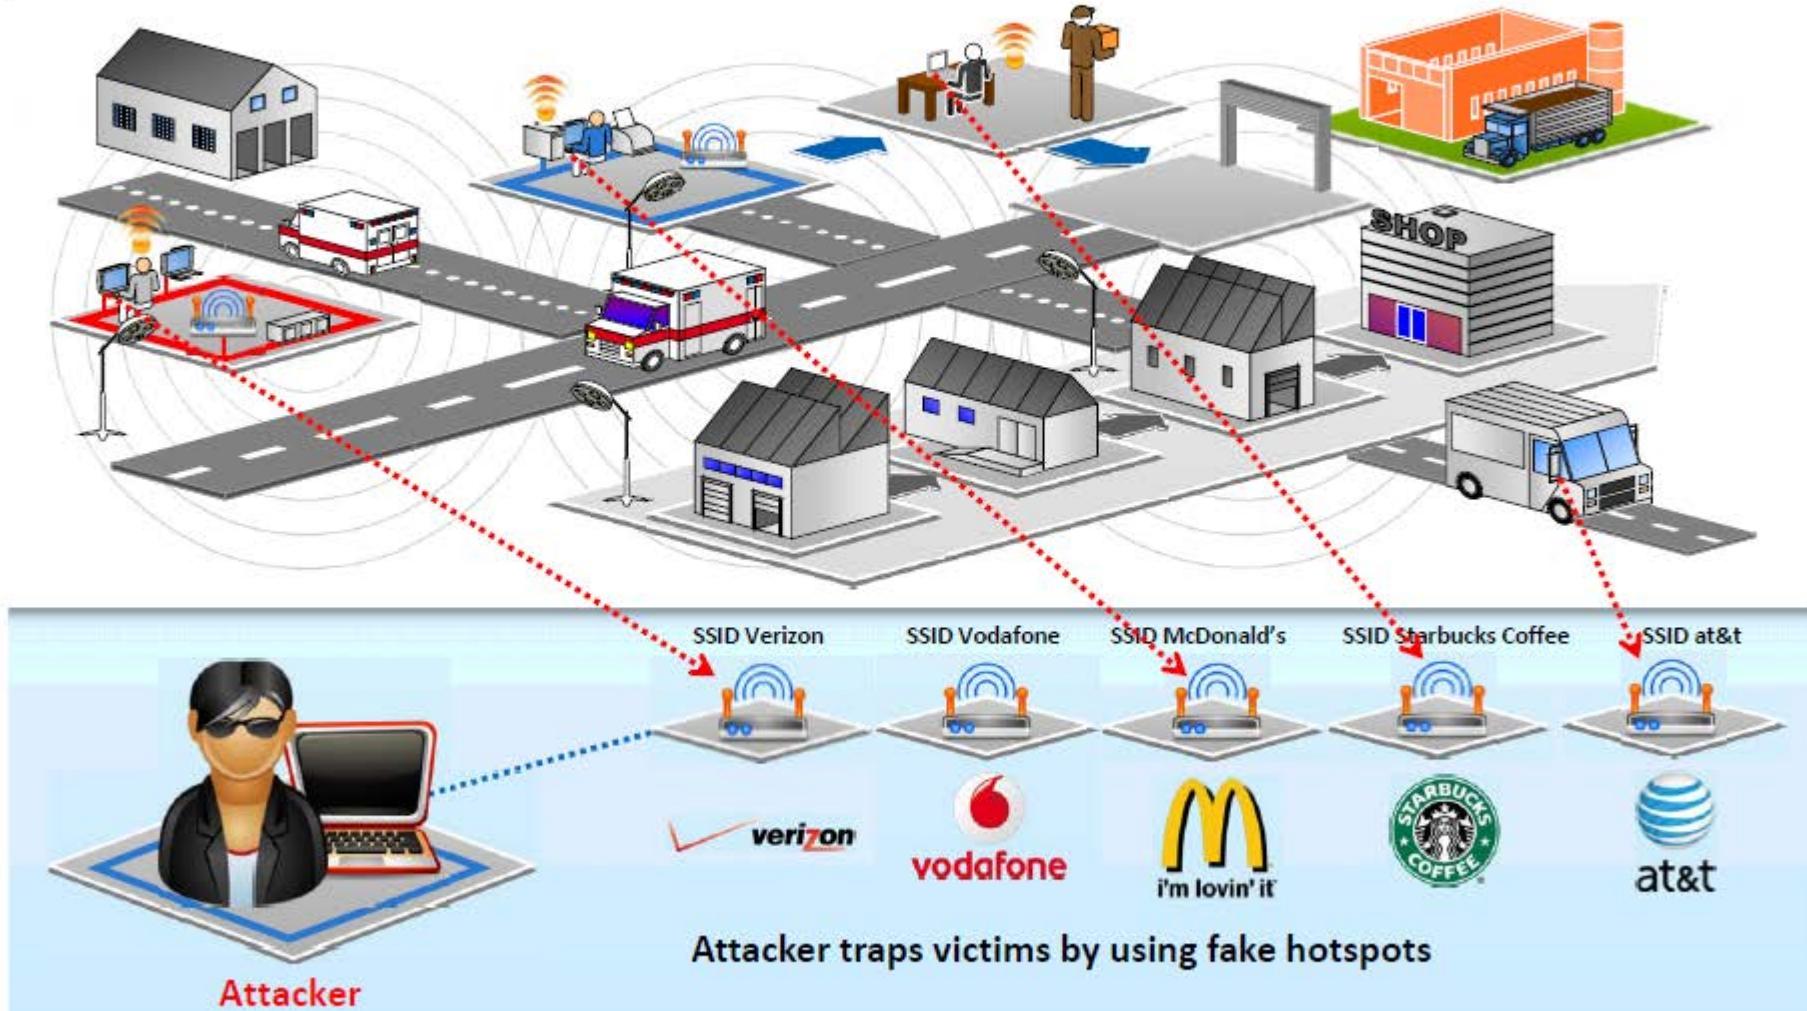

3

Thus attackers can easily connect to and **compromise the enterprise client operating in ad hoc mode**

Wireless Traffic Analysis

4

Launch Wireless Attacks

5

Crack Wi-Fi Encryption

6

Compromise the Wi-Fi Network

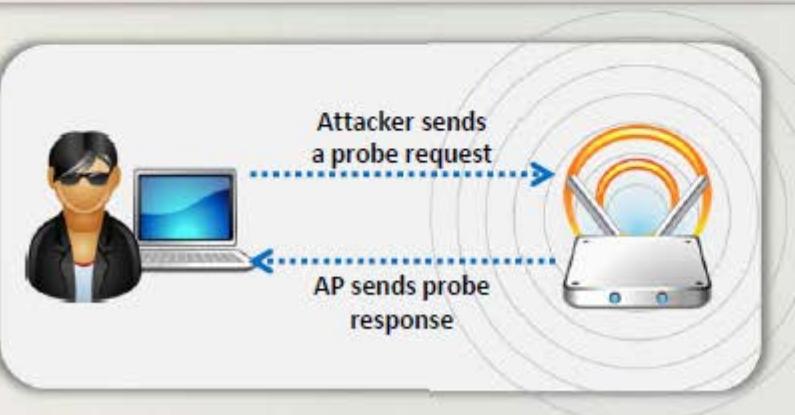

Footprint the Wireless Network

CEH
Certified Ethical Hacker

Attacking a wireless network begins with **discovering** and **footprinting** the wireless network in an active or passive way

Passive Footprinting Method

An attacker can use the passive way to **detect the existence of an AP** by sniffing the packets from the airwaves, which will reveal the AP, SSID and attacker's wireless devices that are live

Active Footprinting Method

In this method, attacker's wireless device **sends out a probe request with the SSID** to see if an AP responds. If the wireless device does not have the SSID in the beginning, it will send the probe request with an empty SSID

Find Wi-Fi Networks to Attack

Steps

1. The first task an attacker will go through when searching for Wi-Fi targets is **checking the potential networks** that are in range to find the best one to attack
2. Drive around with **Wi-Fi enabled laptop** installed with a wireless discovery tool and map out active wireless networks

You will need these
to discover Wi-Fi networks

Laptop with Wi-Fi Card

External Wi-Fi Antenna

Network Discovery Programs

Tools Used: inSSIDer, NetSurveyor, NetStumbler, Vistumbler, etc.

Wi-Fi Discovery Tools: inSSIDer and NetSurveyor

inSSIDer

- Inspect WLAN and surrounding networks to troubleshoot competing access points
- Track the strength of received signal in dBm over time and filter access points in an easy-to-use format

<http://www.inssider.com>

NetSurveyor

- NetSurveyor is a network discovery tool used to gather information about nearby wireless access points in real time and displays it in useful ways

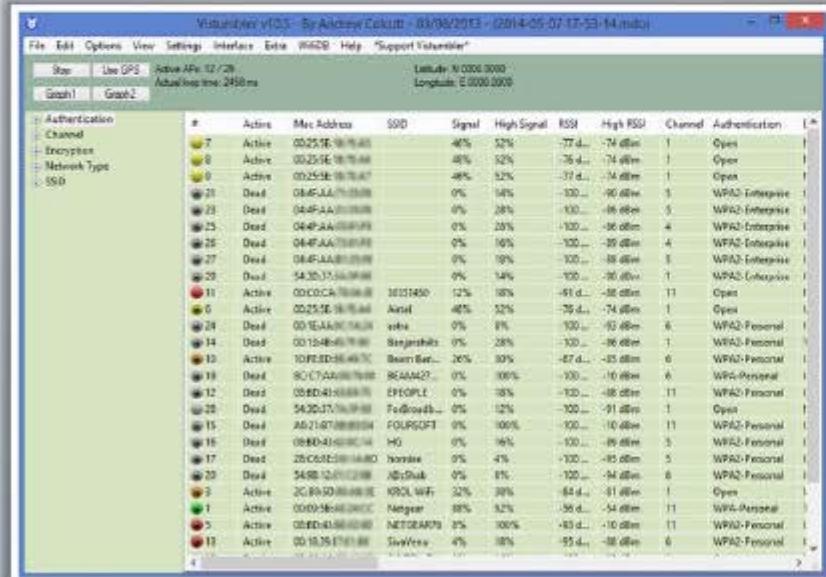

<http://nutsaboutnets.com>

Wi-Fi Discovery Tools: Vistumbler and NetStumbler

Vistumbler

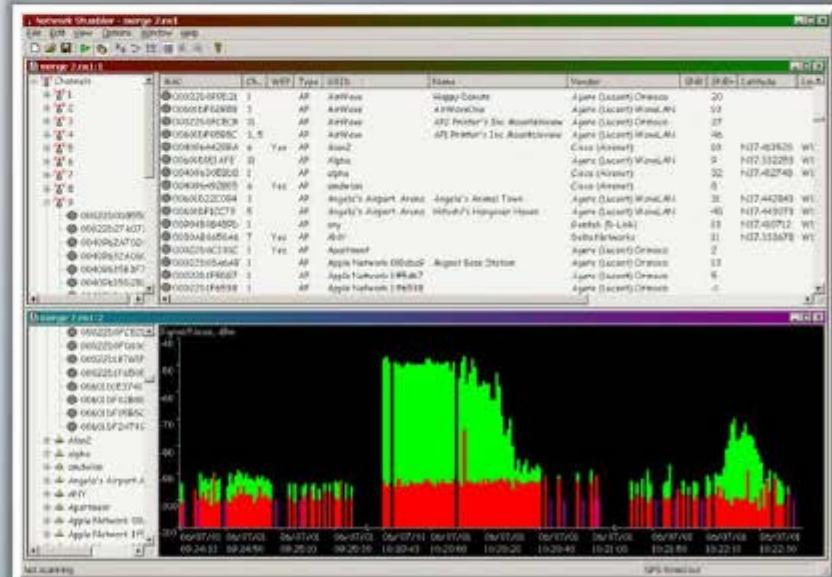

- Finds **wireless access points**
- Uses the **Vista command** 'netsh wlan show networks mode=bssid' to get wireless information
- It supports for **GPS** and **live Google Earth tracking**

<http://www.vistumbler.net>

NetStumbler

- Facilitates detection of Wireless LANs using the **802.11b**, **802.11a**, and **802.11g** WLAN standards
- It is commonly used for **wardriving**, **verifying network configurations**, finding locations with poor coverage in one's WLAN, etc.

6

Compromise the Wi-Fi Network

GPS Mapping

CEH
Certified Ethical Hacker

Attackers create map of discovered Wi-Fi networks and **create a database** with statistics collected by Wi-Fi discovery tools such as NetSurveyor, NetStumblers, etc.

- GPS is used to **track the location** of the discovered Wi-Fi networks and the **coordinates are uploaded to sites** like WIGLE
- Attackers can **share this information** with the hacking community or sell it to make money

Attacker

Discovery of Wi-Fi networks

Post the GPS locations to WIGLE

GPS Mapping Tool: WiGLE

CEH
Certified Ethical Hacker

WiGLE consolidates location and information of wireless networks world-wide to a central database, and provides user-friendly Java, Windows, and web applications that can map, query and update the database via the web

You can add a wireless network to WiGLE from a stumble file or by hand and add remarks to an existing network

Showing stations: 1 through 100 of this query.

<http://wigle.net>

GPS Mapping Tool: Skyhook

CEH
Certified Ethical Hacker

- Skyhook's Wi-Fi Positioning System (WPS) **determines location based** on Skyhook's massive worldwide database of known Wi-Fi access points

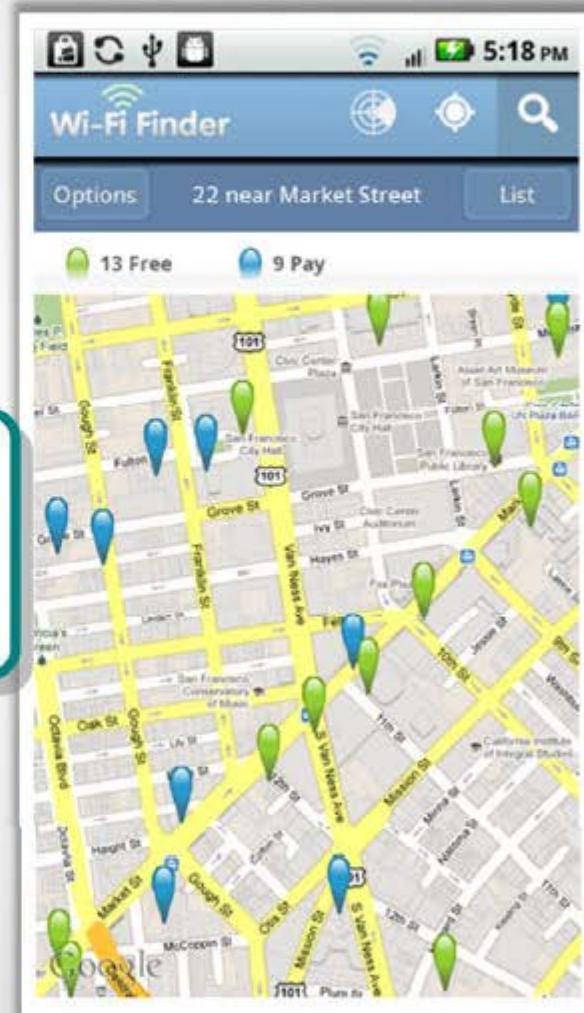

<http://www.skyhookwireless.com>

Wi-Fi Hotspot Finder: Wi-Fi Finder

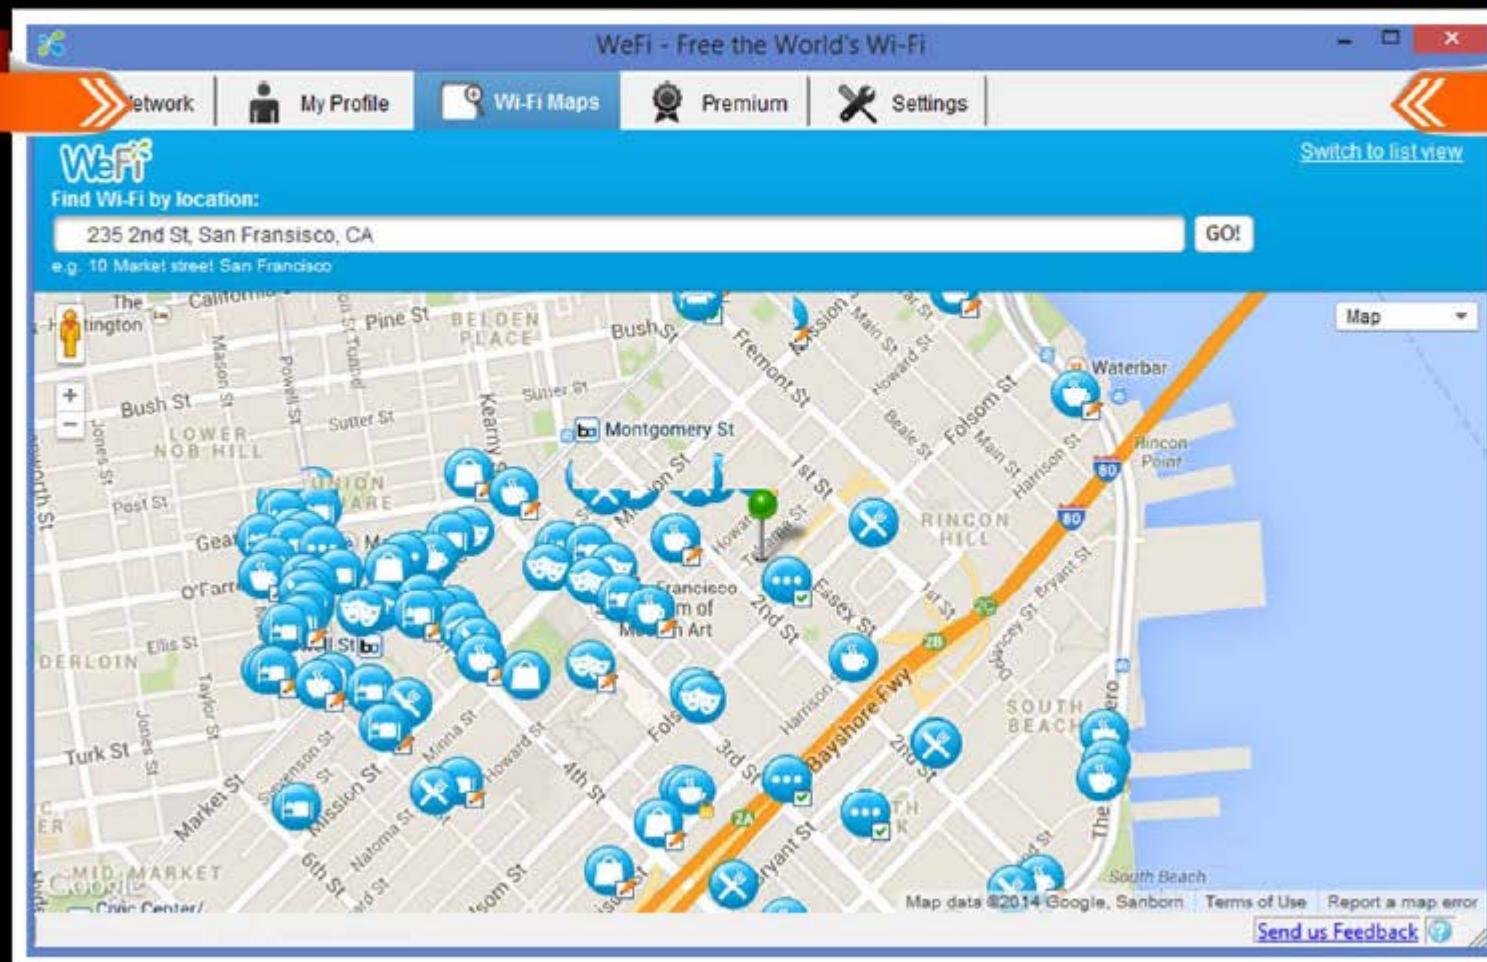

CEH
Certified Ethical Hacker

The screenshot shows the JiWire Global Wi-Fi Finder website. At the top, there's a navigation bar with links for Advertisers, Partners, Wi-Fi Finder, and Company. Below the navigation is a search bar with the placeholder "Find Wi-Fi by city or zip". A banner below the search bar says "It's free & easy. Find & map hotspots with JiWire's Wi-Fi Finder for iPhone". The main area features a map of San Francisco with many green and blue location pins. A callout box highlights a specific area with the text: "JiWire is a Wi-Fi hotspot location directory with more than **890,058** free and paid Wi-Fi hotspots in **145 countries**". Below the map is a URL: <http://v4.jiwire.com>.

Wi-Fi Hotspot Finder: WeFi

CEH
Certified Ethical Hacker

<http://www.wifi.com>

How to Discover Wi-Fi Network Using Wardriving

STEP 1

Register with **WIGLE** and download map packs of your area to view the plotted access points on a geographic map

STEP 2

Connect the antenna, GPS device to the laptop via a USB serial adapter and board on a car

STEP 3

Install and launch **NetStumbler** and **WIGLE** client software and turn on the GPS device

STEP 4

Drive the car at speeds of **35 mph or below** (At higher speeds, Wi-Fi antenna will not be able to detect Wi-Fi spots)

STEP 5

Capture and save the **NetStumbler log files** which contains GPS coordinates of the access points

STEP 6

Upload this log file to WIGLE, which will then automatically plot the points onto a map

Wireless Hacking Methodology

The objective of the wireless hacking methodology is to **compromise a Wi-Fi network** in order to gain unauthorized access to network resources

1

Wi-Fi Discovery

3

Wireless Traffic Analysis

5

Crack Wi-Fi Encryption

2

GPS Mapping

4

Launch Wireless Attacks

6

Compromise the Wi-Fi Network

Wireless Traffic Analysis

CEH
Certified Ethical Hacker

Identify Vulnerabilities

- Wireless traffic analysis enables attackers to **identify vulnerabilities** and susceptible victims in a target wireless network
- This helps in **determining the appropriate strategy** for a successful attack
- Wi-Fi protocols are unique at Layer 2, and traffic over the air is not serialized which makes easy to **sniff and analyze wireless packets**

Wi-Fi Reconnaissance

- Attackers analyze a wireless network to determine:
- Broadcasted **SSID**
 - Presence of **multiple access points**
 - Possibility of **recovering SSIDs**
 - Authentication method** used
 - WLAN** encryption algorithms

Tools

Wi-Fi packet-capture and **analysis products** come in a number of forms:

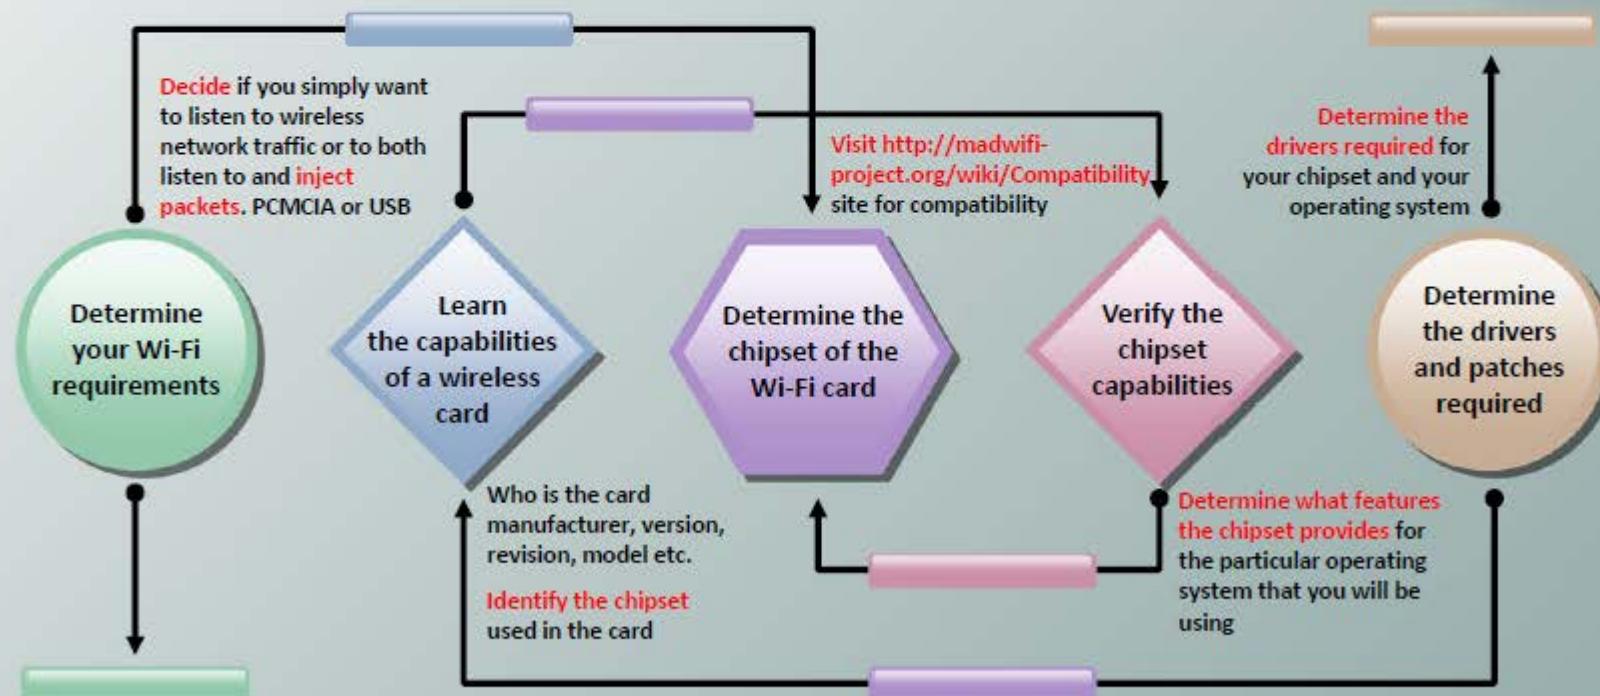

- Wireshark/Pilot Tool
- OmniPeek Tool
- CommView Tool
- AirMagnet Wi-Fi Analyzer

Wireless Cards and Chipsets

CEH
Certified Ethical Hacker

Choosing the right Wi-Fi card is very important since tools like Aircrack-ng, KisMAC only works with selected wireless chipsets

Wi-Fi USB Dongle: AirPcap

CEH
Certified Ethical Hacker

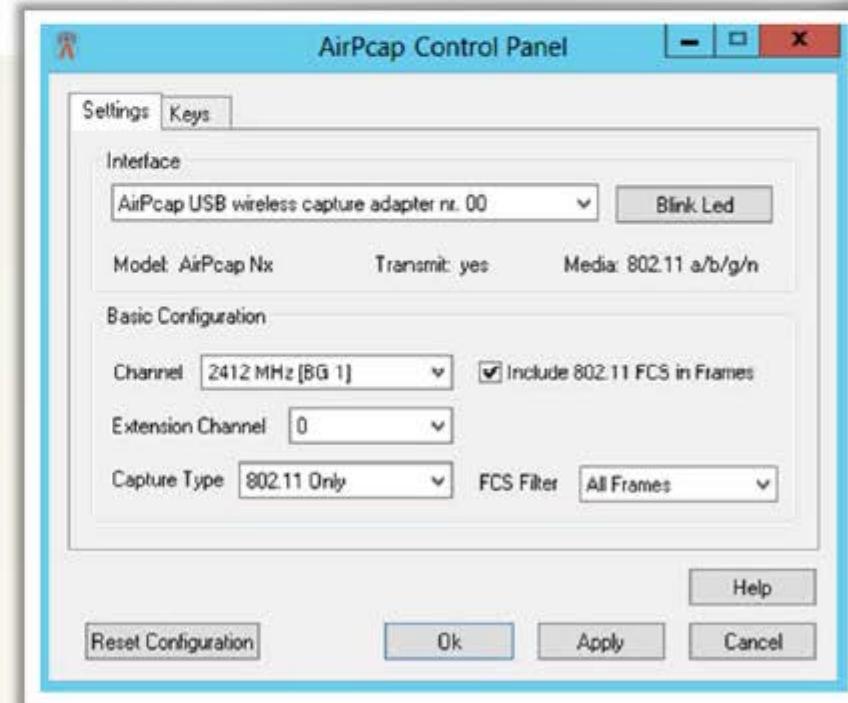

- AirPcap adapter **captures full 802.11 data, management, and control frames** that can be viewed in Wireshark for in-depth protocol dissection and analysis
- AirPcap software can be configured **to decrypt WEP/WPA-encrypted frames**

Features

- It **provides capability** for simultaneous multi-channel capture and traffic aggregation
- It can be used for **traffic injection** that help in assessing the security of a wireless network
- AirPcap is supported in **Aircrack-ng, Cain & Able**, and **Wireshark** tools
- **AirPcapReplay**, included in the AirPcap Software Distribution, replays 802.11 network traffic that is contained in a trace file

<http://www.wireshark.org>

Wi-Fi Packet Sniffer: SteelCentral Packet Analyzer

- It measures wireless channel utilization
- It helps in Identifying **rogue wireless networks** and stations
- It isolates specific packets
- It provides an interactive and visually-oriented **user interface**

<http://www.riverbed.com>

Wi-Fi Packet Sniffer: OmniPeek Network Analyzer

- OmniPeek Network Analyzer offers **real-time visibility and analysis** of the network traffic from a single interface, including Ethernet, 802.11a/b/g/n wireless and VoIP
- It provides a comprehensive view of all **wireless network activity** showing each wireless network, the APs comprising that network, and the users connected to each AP

Wi-Fi Packet Sniffer: CommView for Wi-Fi

- CommView for Wi-Fi is designed for **capturing and analyzing network packets** on wireless 802.11a/b/g/n networks

Features

- It **gathers information** from the wireless adapter and decodes the analyzed data
- It can **decrypt packets** utilizing user-defined WEP or WPA-PSK keys and decode them to the lowest layer, with full analysis of the most widespread protocol

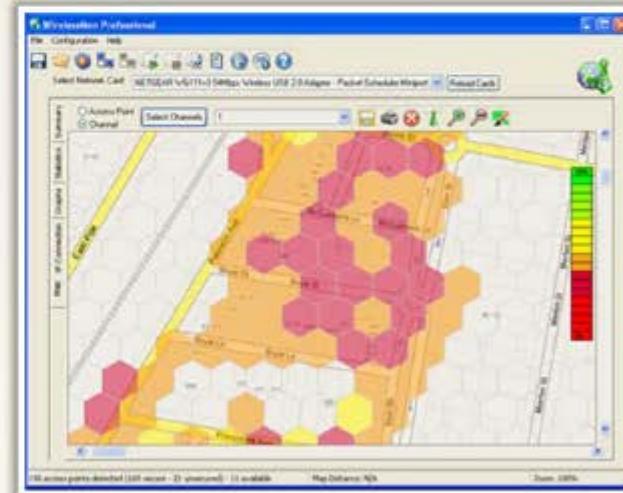

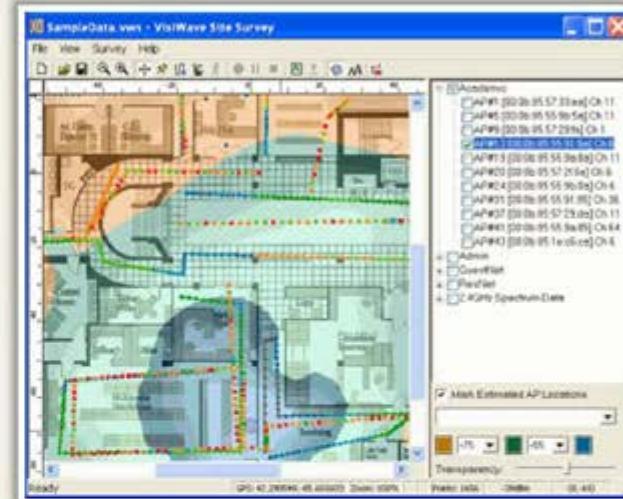

<http://www.lumos.com>

What is Spectrum Analysis?

CEH
Certified Ethical Hacker

- RF spectrum analyzers **examine Wi-Fi radio transmissions** and measure the power (amplitude) of radio signals and RF pulses, and transform these measurements into numeric sequences
- Spectrum analyzers **employ statistical analysis** to plot spectral usage, quantify "air quality," and isolate transmission sources
- RF spectrum analyzers are used by RF technicians to install and maintain wireless networks, and identify **sources of interference**
- Wi-Fi spectrum analysis also helps in **wireless attack detection**, including Denial of Service attacks, authentication/ encryptions attacks, network penetration attacks, etc.
- **Spectrum Analysis Tools**
 - Wi-Spy and Chanalyzer
 - AirMagnet Wi-Fi Analyzer
 - WifiEagle

Wireless Hacking Methodology

The objective of the wireless hacking methodology is to **compromise a Wi-Fi network** in order to gain unauthorized access to network resources

1

Wi-Fi Discovery

3

Wireless Traffic Analysis

5

Crack Wi-Fi Encryption

2

GPS Mapping

4

Launch Wireless Attacks

6

Compromise the Wi-Fi Network

Aircrack-ng Suite

CEH
Certified Ethical Hacker

- Aircrack-ng is a **network software suite** consisting of a detector, packet sniffer, WEP and WPA/WPA2-PSK cracker and analysis tool for 802.11 wireless networks. This program runs under Linux and Windows.

<http://www.aircrack-ng.org>

Airbase-ng

Captures WPA/WPA2 handshake and can act as an ad-hoc Access Point

Aircrack-ng

Defacto WEP and WPA/ WPA2-PSK cracking tool

Airdecap-ng

Decrypt WEP/WPA/ WPA2 and can be used to strip the wireless headers from Wi-Fi packets

Airdecloak-ng

Removes WEP cloaking from a pcap file

Airdriver-ng

Provides status information about the wireless drivers on your system

Airdrop-ng

This program is used for targeted, rule-based deauthentication of users

Aireplay-ng

Used for traffic generation, fake authentication, packet replay, and ARP request injection

Airgraph-ng

Creates client to AP relationship and common probe graph from airodump file

Airodump-ng

Used to capture packets of raw 802.11 frames and collect WEP IVs

Airolib-ng

Store and manage essid and password lists used in WPA/ WPA2 cracking

Airserv-ng

Allows multiple programs to independently use a Wi-Fi card via a client-server TCP connection

Airmon-ng

Used to enable monitor mode on wireless interfaces from managed mode and vice versa

Airtun-ng

Injects frames into a WPA TKIP network with QoS, and can recover MIC key and keystream from Wi-Fi traffic

Easside-ng

Allows you to communicate via a WEP-encrypted access point (AP) without knowing the WEP key

Packetforge-ng

Used to create encrypted packets that can subsequently be used for injection

Tkiptun-ng

Creates a virtual tunnel interface to monitor encrypted traffic and inject arbitrary traffic into a network

Wesside-ng

Incorporates a number of techniques to seamlessly obtain a WEP key in minutes

How to Reveal Hidden SSIDs

CEH
Certified Ethical Hacker

C:\ Command Prompt

```
C:\>airmon-ng start eth1
C:\>airodump-ng --ivs --write capture eth1
```

BSSID	PWR	RXQ	Beacons	#Data, #/s	CH	MB	ENC	CIPHER	AUTH	ESSID
02:24:2B:CD:68:EF	99	5	60	3 0	1	54e	OPN			IAMROGER
02:24:2B:CD:68:EE	99	9	75	2 0	5	54e	OPN			COMPANYZONE
00:14:6C:95:6C:FC	99	0	15	0 0	9	54e	WEP	WEP		HOME
00:22:3F:AE:68:6E	76	70	157	1 0	11	54e	WEP	WEP		<length: 10>

BSSID	Station	PWR	Rate	Lost	Packets	Probes
00:22:3F:AE:68:6E	00:17:9A:C3:CF:C2	-1	1 - 0	0	1	
00:22:3F:AE:68:6E	00:1F:5B:BA:A7:CD	76	1e-54	0	6	

Step 1: Run airmon-ng in monitor mode

Step 2: Start airodump to discover SSIDs on interface

Hidden SSID

Step 3: De-authenticate (deauth) the client to reveal hidden SSID using Aireplay-ng

Step 4: Switch to airodump to see the revealed SSID

C:\ Command Prompt

```
C:\>aireplay-ng --deauth 11 -a 00:22:3F:AE:68:6E
```

BSSID	PWR	RXQ	Beacons	#Data, #/s	CH	MB	ENC	CIPHER	AUTH	ESSID
00:22:3F:AE:68:6E	76	70	157	1 0	11	54e	WEP	WEP		Secret_SSID

Fragmentation Attack

- A fragmentation attack, when successful, can obtain **1500 bytes of PRGA** (pseudo random generation algorithm)
- This attack **does not recover** the WEP key itself, but merely obtains the PRGA
- The PRGA can then be used to generate packets with **packetforge-ng** which are in turn used for various injection attacks
- It requires at least **one data packet** to be received from the access point in order to initiate the attack

```
C:\ Command Prompt
C:\>aireplay-ng -5 -b 00:14:6C:7E:40:80 -h 00:0F:B5:AB:CB:9D ath0

Saving chosen packet in replay_src-0124-161120.cap
Data packet found!
Sending fragmented packet
Got RELAYED packet!!
Thats our ARP packet!
Trying to get 384 bytes of a keystream
Got RELAYED packet!!
Thats our ARP packet!
Trying to get 1500 bytes of a keystream
Got RELAYED packet!!
Thats our ARP packet!
Saving keystream in fragment-0124-161129.xor
Now you can build a packet with packetforge-ng out of
that 1500 bytes keystream
```

PRGA is stored in the file

Use PRGA with **packetforge-ng** to generate packet(s) to be used for various **injection attacks**

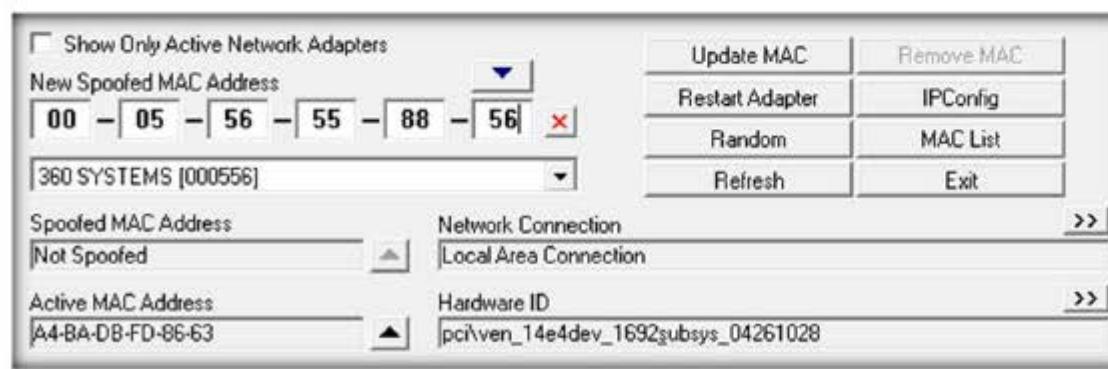

How to Launch MAC Spoofing Attack

MAC spoofing attackers **change the MAC address** to that of an authenticated user to bypass the MAC filtering configured in an access point

Linux Shell

```
[root@localhost root]# ifconfig wlan0 down ← Logging as root and disable the network interface
[root@localhost root]# ifconfig wlan0 hw ether 02:25:ab:4c:2a:bc ← Enter the new MAC address
[root@localhost root]# ifconfig wlan0 up ← Bring the interface back up
```

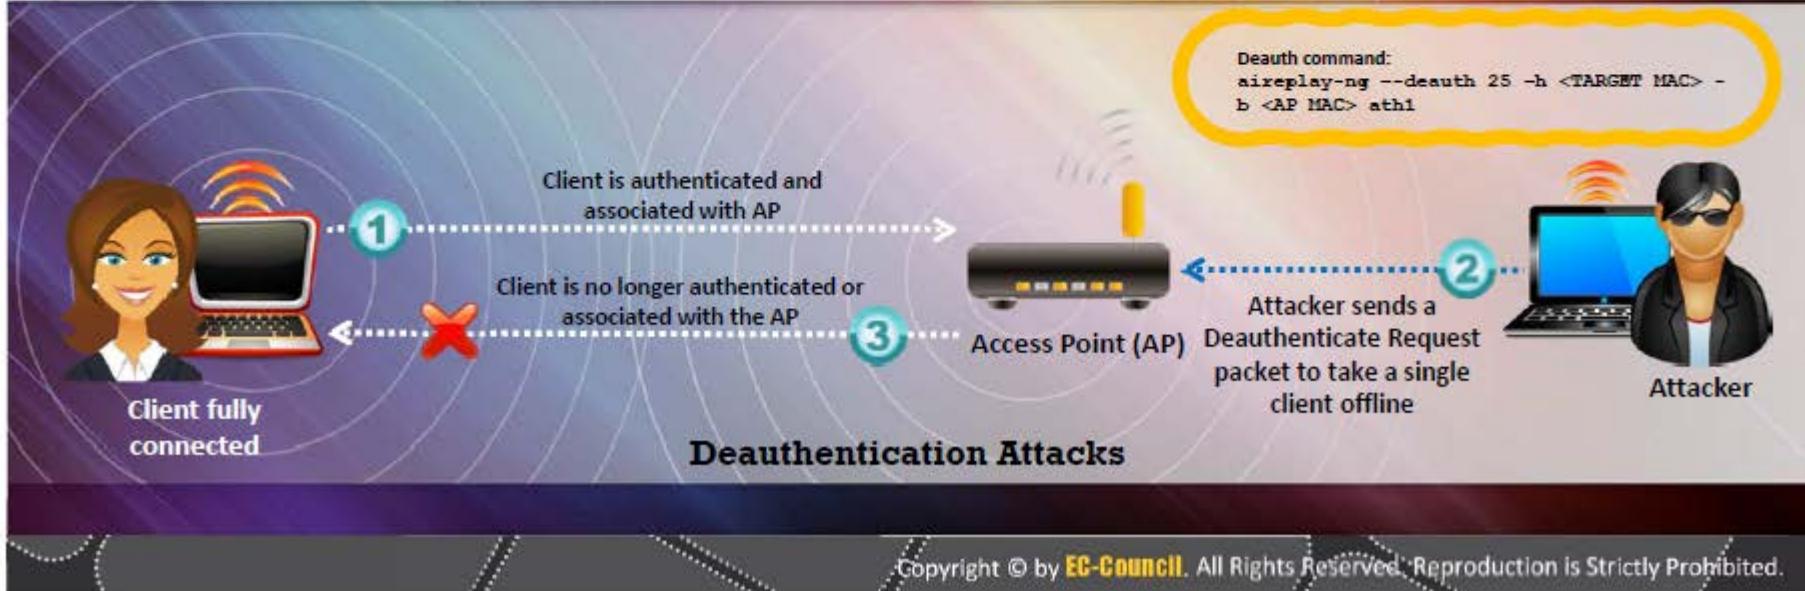

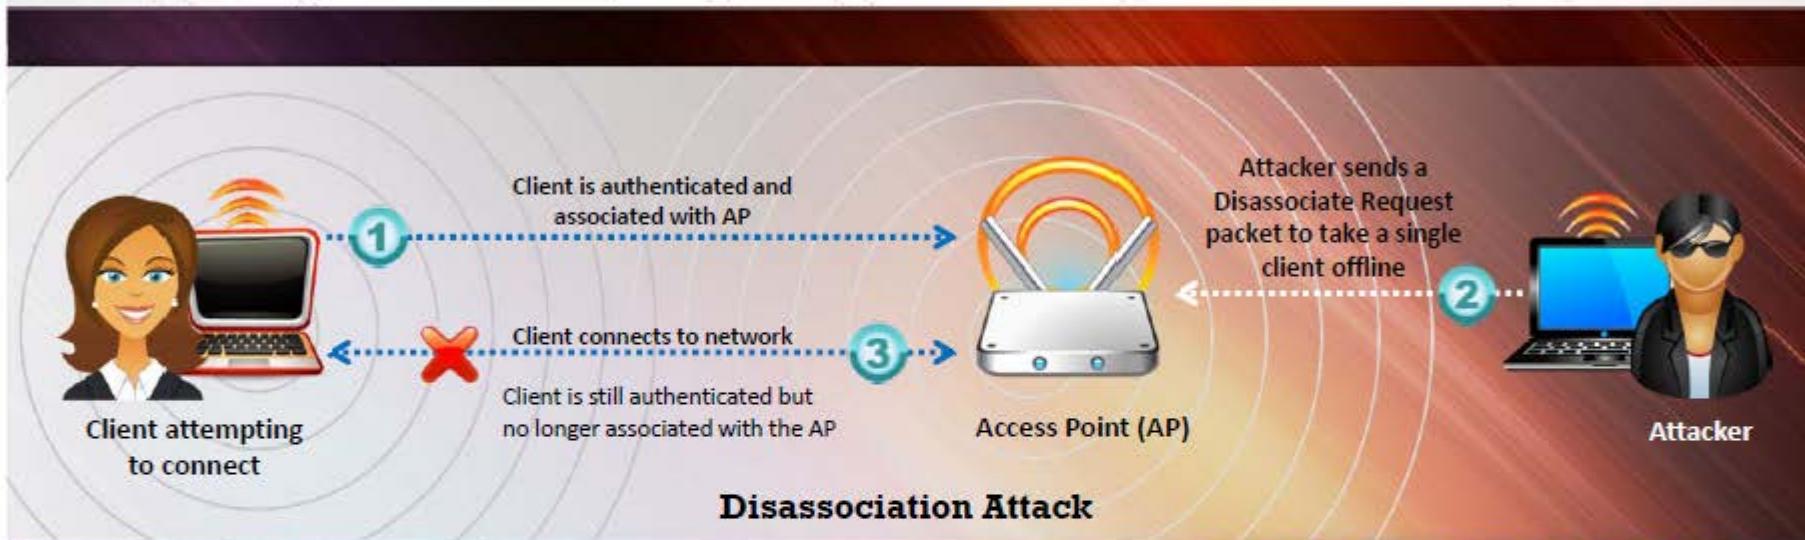

SMAC is a **MAC address changer** for Windows systems
Randomly generate any New MAC Address or based on a selected manufacturer

Denial of Service: Deauthentication and Disassociation Attacks

MITM Attack Using Aircrack-ng

C:\ Command Prompt

```
C:\>airmon-ng start eth1
C:\>airodump-ng -ivs -write capture eth1
```

BSSID	PWR	RXQ	Beacons	#Data,	#/s	CH	MB	ENC	CIPHER	AUTH	ESSID
02:24:2B:CD:68:EF	99	5	60	3	0	1	54e	OPN			IAMROGER
02:24:2B:CD:68:EE	99	9	75	2	0	5	54e	OPN			COMPANYZONE
00:14:6C:95:6C:FC	99	0	15	0	0	9	54e	WEP	WEP		HOME
1E:64:51:3B:FF:3E	76	70	157			1	0	11	54e	WEP	SECRET_SSID

BSSID	Station	PWR	Rate	Lost	Packets	Probes
1E:64:51:3B:FF:3E	00:17:9A:C3:CF:C2	-1	1-0	0	1	
1E:64:51:3B:FF:3E	00:1F:5B:BA:A7:CD	76	1e-54	0	6	

Step 1: Run airmon-ng in monitor mode

Step 2: Start airodump to discover SSIDs on interface

C:\ Command Prompt

```
C:\>aireplay-ng --deauth 5 -a 02:24:2B:CD:68:EE
```

Step 3: De-authenticate (deauth) the client using Aireplay-ng

C:\ Command Prompt

```
C:\>aireplay-ng -1 0 -e SECRET_SSID -a 1e:64:51:3b:ff:3e -h 02:24:2B:CD:68:EE eth1
22:25:10 Waiting for beacon frame (BSSID: 1E:64:51:3B:FF:3E) on channel 11

22:25:10 Sending Authentication Request
22:25:10 Authentication successful
22:25:10 Sending Association Request
22:25:10 Association successful :-)
```

Step 4: Associate your wireless card (fake association) with the AP you are accessing with aireplay-ng

Wireless ARP Poisoning Attack

CEH
Certified Ethical Hacker

1
Attacker **spoofs the MAC** address of Jessica's Wireless Laptop and attempts to authenticate to AP1

2
AP1 sends **updated MAC address** info to the network routers and switches, which in turn **update** their routing and switching tables

3
Traffic now **destined** from the network backbone to Jessica's system is no longer sent to AP2

Rogue Access Point

CEH
Certified Ethical Hacker

Compact, pocket-sized rogue AP device plugged into an Ethernet port of corporate network

- Choose an **appropriate location** to plug in your rogue access point that allows maximum coverage from your connection point
- Disable the **SSID Broadcast** (silent mode) and any management features to avoid detection
- Place the access point behind a **firewall**, if possible, to avoid network scanners
- Deploy a **rogue access point** for short period

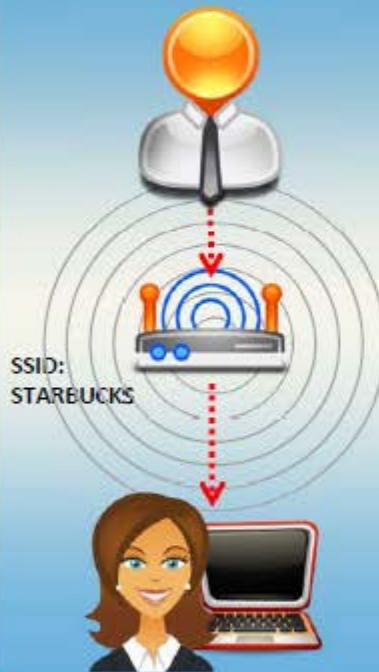

Software-based rogue access point running on a corporate Windows machine

Rogue access point device connected to corporate networks over a Wi-Fi link

USB-based rogue access point device plugged into a corporate machine

Evil Twin

Authorized Wi-Fi

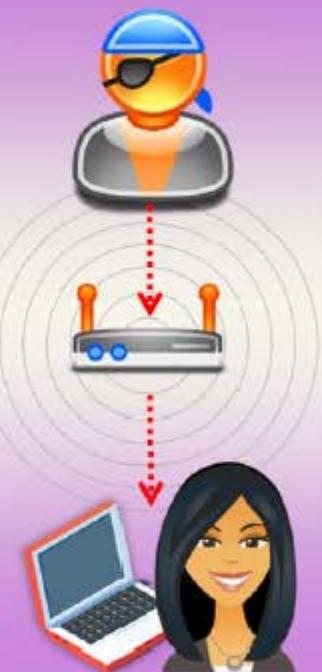

Evil Twin is a wireless AP that pretends to be a legitimate AP by replicating another network name

Attacker sets up a rogue AP outside the corporate perimeter and lures user to sign into the wrong AP

Once associated, users may bypass the enterprise security policies giving attackers access to network data

Evil Twin can be configured with a common residential SSID, hotspot SSID or SSID of a company's WLAN

Evil Twin

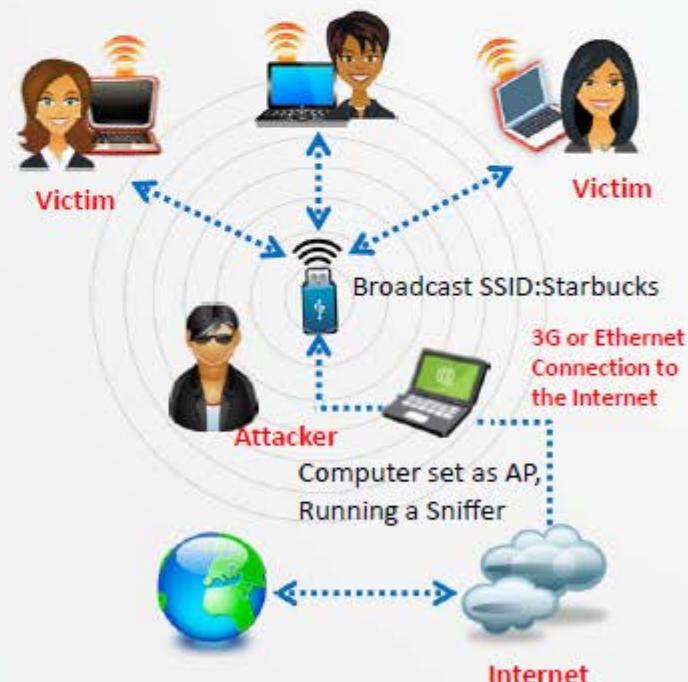

Wi-Fi is everywhere these days and so are your employees. They take their **laptops** to Starbucks, to FedEx Office, and to the airport. How do you keep the **company data safe**?

How to Set Up a **Fake Hotspot** **(Evil Twin)**

- You will need a laptop with **Internet connectivity** (3G or wired connection) and a mini access point
- Enable **Internet Connection Sharing** in Windows 8 or Internet Sharing in Mac OS X
- Broadcast your Wi-Fi connection and run a **sniffer program** to capture passwords

A user tries to log in and finds **two access points**. One is legitimate, while the other is an identical fake (evil twin). Victim picks one, if it's the fake, the hacker gets **login information** and access to the computer. In the meantime, the user goes nowhere. He or she probably thinks it was just a **login attempt** that randomly failed.

Wireless Hacking Methodology

The objective of the wireless hacking methodology is to **compromise a Wi-Fi network** in order to gain unauthorized access to network resources

1

Wi-Fi Discovery

3

Wireless Traffic Analysis

5

Crack Wi-Fi Encryption

2

GPS Mapping

4

Launch Wireless Attacks

6

Compromise the Wi-Fi Network

How to Crack WEP Using Aircrack

```
C:\ Command Prompt  
C:\>airmon-ng start eth1 ↵  
C:\>airodump-ng --ivs --write capture eth1 ↵  

| BSSID             | PWR | RXQ | Beacons | #Data, | #/s | CH | MB  | ENC | CIPHER | AUTH | ESSID       |
|-------------------|-----|-----|---------|--------|-----|----|-----|-----|--------|------|-------------|
| 02:24:2B:CD:68:EF | 99  | 5   | 60      | 3      | 0   | 1  | 54e | OPN |        |      | IAMROGER    |
| 02:24:2B:CD:68:EE | 99  | 9   | 75      | 2      | 0   | 5  | 54e | OPN |        |      | COMPANYZONE |
| 00:14:6C:95:6C:FC | 99  | 0   | 15      | 0      | 0   | 9  | 54e | WEP | WEP    |      | HOME        |
| 1E:64:51:3B:FF:3E | 76  | 70  | 157     | 1      | 0   | 11 | 54e | WEP | WEP    |      | SECRET_SSID |

| BSSID             | Station           | PWR | Rate  | Lost | Packets | Probes |
|-------------------|-------------------|-----|-------|------|---------|--------|
| 1E:64:51:3B:FF:3E | 00:17:9A:C3:CF:C2 | -1  | 1 - 0 | 0    | 1       |        |
| 1E:64:51:3B:FF:3E | 00:1F:5B:BA:A7:CD | 76  | 1e-54 | 0    | 6       |        |

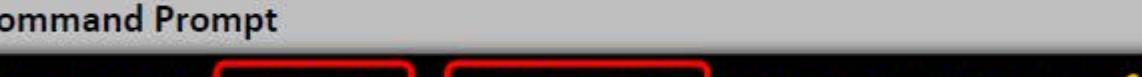

```

Step 1: Run airodump in monitor mode

- **Step 2:** Start airodump to discover SSIDs on interface and keep it running. Your capture file should contain more than 50,000 IVs to successfully crack the WEP key.

- **Step 3:** Associate your wireless card with target access point

```
C:\ Command Prompt
C:\>aireplay-ng -1 0 -e SECRET_SSID -a 1e:64:51:3b:ff:3e -h a7:71:fe:8e:d8:25 eth1 <.....
22:25:10 Waiting for beacon frame (BSSID: 1E:64:51:3B:FF:3E) on Channel 11
22:25:10 Sending Authentication Request
22:25:10 Authentication successful
22:25:10 Sending Association Request
22:25:10 Association successful :-)

```

How to Crack WEP Using Aircrack

(Cont'd)

C:\ Command Prompt

```
C:\>aireplay-ng -3 -b 1e:64:51:3b:ff:3e -h a7:71:fe:8e:d8:25 eth1
22:30:15 Waiting for beacon frame (BSSID: 1E:64:51:3B:FF:3E)

Saving ARP requests in replay_arp-0219-123051.cap
You should also start airodump-ng to capture replies
Read 11978 packets (got 7193 ARP requests), sent 3902 packets...
```

Step 4: Inject packets using aireplay-ng to generate traffic on target access point

C:\ Command Prompt

```
C:\>aircrack-ng -s capture.ivs
Opening capture.ivs
Read 75168 packets.

Aircrack-ng 0.7 r130

WPA Brute Forcing Using Cain & Abel

The screenshot shows the Cain & Abel software interface. On the left, there's a configuration panel for an AirPcap USB wireless capture adapter. It displays the driver version (2.0.0.678), TX channels (1,2,3,4,5,6,7,8,9,10,11), and the current channel (9). There are checkboxes for 'Lock on channel' (set to 9) and 'WPA-PSK Auths' (which is checked and highlighted with a red box). Another checked box is 'Send to Cracker'. Below these are options for 'Capture WEP IVs to dump.nvs file' and 'File size: 24 bytes'. Buttons for 'Analyze', 'Delete', and 'Save As' are also present. To the right of this panel are two tables. The top table lists wireless networks (BSSIDs) with columns for Last seen, Vendor, Signal, SSID, Enc, Mode, Channel, and Rates (Mbps). One entry shows a 3COM EUR... SSID with WPA encryption. The bottom table lists MAC addresses with columns for Last seen, Vendor, Signal, Rate, Packets, and ARP Requests. An Intel Corp... MAC address is shown with 54 Mbps. A callout box highlights the text: "Cain can recover passwords by sniffing the wireless network, and crack WPA-PSK encrypted passwords using dictionary and brute-force attacks". At the bottom of the interface, there are tabs for 'Sniffer', 'Cracker', 'Traceroute', 'CCDU', and 'Wireless'.

Cain can **recover passwords** by sniffing the wireless network, and **crack WPA-PSK encrypted passwords** using dictionary and brute-force attacks

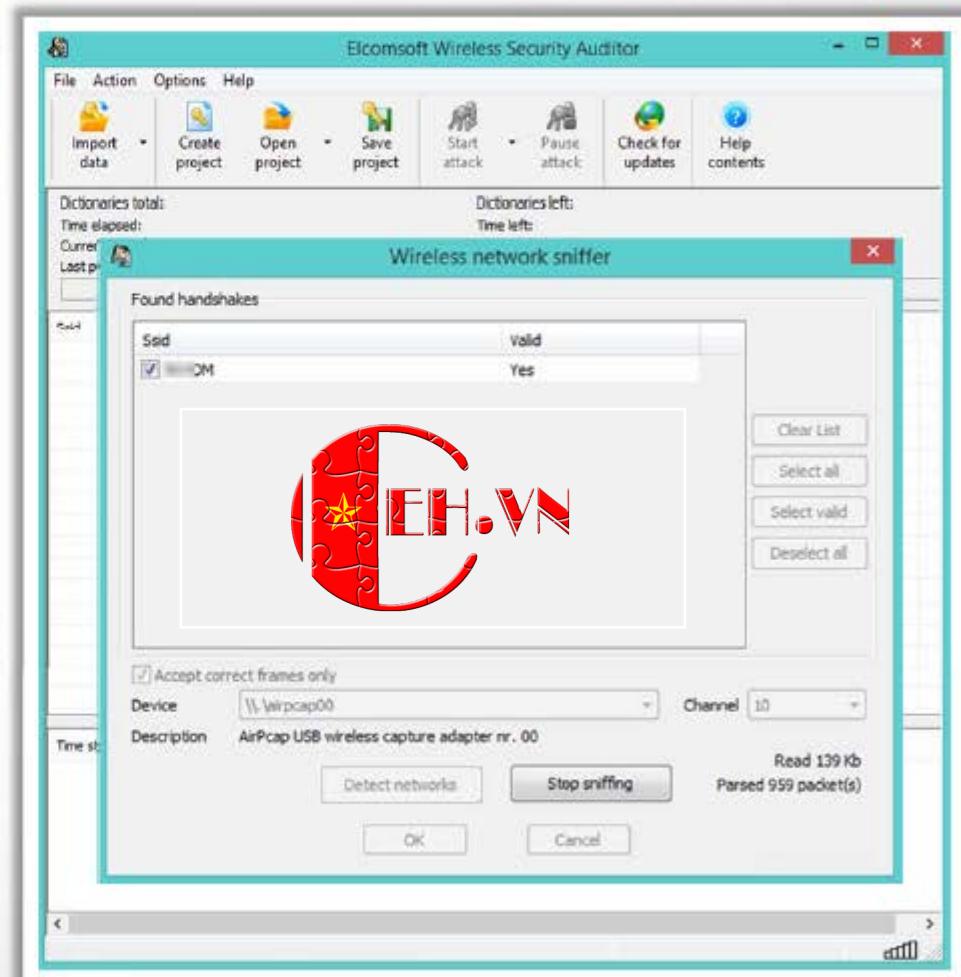

WPA Cracking Tool: Elcomsoft Wireless Security Auditor

Elcomsoft Wireless Security Auditor allows network administrators to audit accessible wireless networks

It comes with a built-in wireless network sniffer (with AirPcap adapters)

It tests the strength of WPA/WPA2-PSK passwords protecting your wireless network

Wireless Hacking Tools

Bluetooth Hacking

Countermeasures

Wireless Security Tools

Wi-Fi Pen Testing

Bluetooth Hacking

- Bluetooth hacking refers to **exploitation of Bluetooth stack implementation vulnerabilities** to compromise sensitive data in Bluetooth-enabled devices and networks
- Bluetooth enabled devices connect and communicate wirelessly through **ad hoc** networks known as **Piconets**

Bluesmacking

DoS attack which **overflows Bluetooth-enabled** devices with random packets causing the device to crash

Bluejacking

The art of **sending unsolicited messages** over Bluetooth to Bluetooth-enabled devices such as mobile phones, laptops, etc.

Blue Snarfing

The **theft of information** from a wireless device through a Bluetooth connection

BlueSniff

Proof of concept code for a Bluetooth **wardriving** utility

Bluebugging

Remotely accessing the **Bluetooth-enabled** devices and using its features

Blueprinting

The art of collecting information about **Bluetooth-enabled devices** such as manufacturer, device model and firmware version

MAC Spoofing Attack

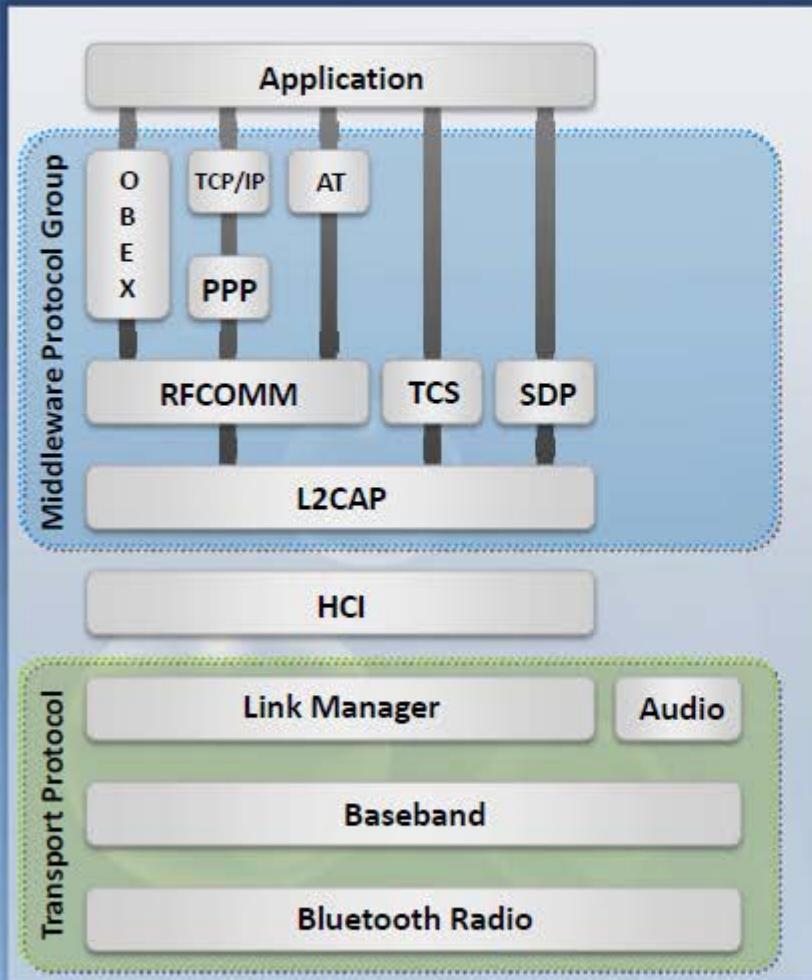

Intercepting data intended for other Bluetooth-enabled devices

Man-in-the-Middle/ Impersonation Attack

Modifying data between Bluetooth-enabled devices communicating in a Piconet

Bluetooth Stack

CEH
Certified Ethical Hacker

Bluetooth Modes

Discoverable modes

- Discoverable:** Sends inquiry responses to all inquiries
- Limited discoverable:** Visible for a certain period of time
- Non-discoverable:** Never answers an inquiry scan

Pairing modes

- Non-pairable mode:** Rejects every pairing request
- Pairable mode:** Will pair upon request

Bluetooth Threats

Leaking Calendars and Address Books

Attacker can steal user's personal information and can use it for malicious purposes

Remote Control

Hackers can remotely control a phone to make phone calls or connect to the Internet

Bugging Devices

Attacker could instruct the user to make a phone call to other phones without any user interaction. They could even record the user's conversation

Social Engineering

Attackers trick Bluetooth users to lower security or disable authentication for Bluetooth connections in order to pair with them and steal information

Sending SMS Messages

Terrorists could send false bomb threats to airlines using the phones of legitimate users

Malicious Code

Mobile phone worms can exploit a Bluetooth connection to replicate and spread itself

Causing Financial Losses

Hackers could send many MMS messages with an international user's phone, resulting in a high phone bill

Protocol Vulnerabilities

Attackers exploit Bluetooth pairings and communication protocols to steal data, make calls, send messages, conduct DoS attacks on a device, start phone spying, etc.

How to BlueJack a Victim

CEH
Certified Ethical Hacker

- Bluejacking is the activity of sending **anonymous messages** over Bluetooth to Bluetooth-enabled devices such as laptops, mobile phones, etc. via the **OBEX** protocol

STEP 1

- Select an area with plenty of mobile users, like a café, shopping center, etc.
- Go to contacts in your address book (You can delete this contact entry later)

STEP 2

- Create a new contact on your phone address book
- Enter the message into the name field

Ex: "Would you like to go on a date with me?"

STEP 3

- Save the new contact with the name text and without the telephone number
- Choose "send via Bluetooth". These searches for any Bluetooth device within range

STEP 4

- Choose one phone from the list discovered by Bluetooth and send the contact
- You will get the message "card sent" and then listen for the SMS message tone of your victim's phone

Bluetooth Hacking Tool: PhoneSnoop

PhoneSnoop is **BlackBerry spyware** that enables an attacker to **remotely activate the microphone** of a BlackBerry handheld and listen to sounds near or around it. PhoneSnoop is a component of Bugs - a proof-of-concept spyware toolkit.

- It exists **solely to demonstrate** the capabilities of a BlackBerry handheld when used to conduct surveillance on an individual
- It is purely a **proof-of-concept application** and does not possess the stealth or spyware features that could make it malicious

<http://www.blackberryrc.com>

Bluetooth Hacking Tool: BlueScanner

A Bluetooth device discovery and vulnerability assessment tool for Windows

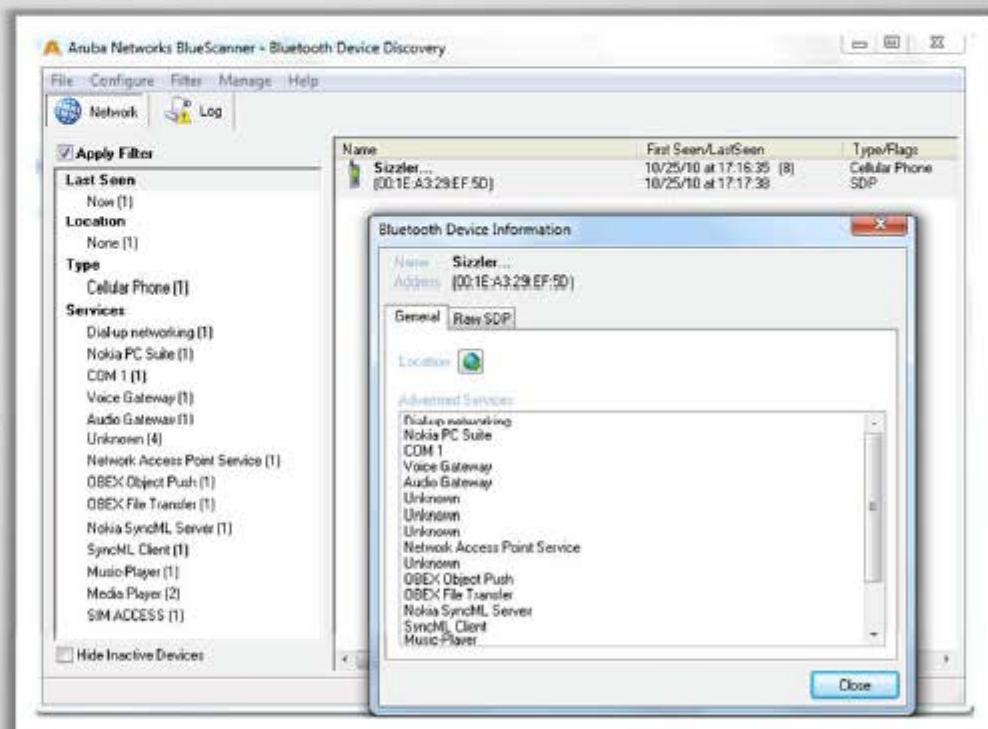

01

Discover Bluetooth devices type (phone, computer, keyboard, PDA, etc.), and the services that are advertised by the devices

02

Records all information that can be gathered from the device, without attempting to authenticating with the remote device

Wi-Fi Pen Testing

How to Defend Against Bluetooth Hacking

Use non-regular patterns as PIN keys while pairing a device. Use those key combinations which are non-sequential on the keypad

Keep BT in the disabled state, enable it only when needed and disable immediately after the intended task is completed

Keep the device in non-discoverable (hidden) mode

DO NOT accept any unknown and unexpected request for pairing your device

Keep a check of all paired devices in the past from time to time and delete any paired device which you are not sure about

Always enable encryption when establishing BT connection to your PC

How to Defend Against Bluetooth Hacking (Cont'd)

1

Set Bluetooth-enabled device **network range to the lowest** and perform pairing only in a **secure area**

2

Install **antivirus** which support host-based security software on Bluetooth-enabled devices

3

Change the default settings of the Bluetooth-enabled device to a **best security standard**

4

Use **Link Encryption** for all Bluetooth connections

5

If multiple wireless communication is being used, make sure that **encryption is empowered** on each link in the communication chain

How to Detect and Block Rogue AP

CEH
Certified Ethical Hacker

Detecting Rogue AP

RF Scanning

Re-purposed access points that do only packet capturing and analysis (RF sensors) are plugged in all over the wired network to detect and warn the WLAN administrator about any wireless devices operating in the area

AP Scanning

Access points that have the functionality of detecting neighboring APs operating in the nearby area will expose the data through its MIBS and web interface

Using Wired Side Inputs

Network management software uses this technique to detect rogue APs. This software detects devices connected in the LAN, including Telnet, SNMP, CDP (Cisco discovery protocol) using multiple protocols

Blocking Rogue AP

- Deny wireless service to new clients by launching a **denial-of-service attack** (DoS) on the rogue AP
- Block the switch port** to which AP is connected or manually locate the AP and pull it physically off the LAN

Wireless Security Layers

Wireless Signal Security

RF Spectrum Security, Wireless IDS

Data Protection

WPA2 and AES

Connection Security

Per-Packet Authentication, Centralized Encryption

Network Protection

Strong Authentication

Device Security

Vulnerabilities and Patches

End-user Protection

Stateful Per User Firewalls

How to Defend Against Wireless Attacks

Configuration Best Practices

Change the **default SSID** after WLAN configuration

Set the **router access password** and enable firewall protection

Disable **SSID broadcasts**

SSID Settings Best Practices

Disable **remote router login** and wireless administration

Enable **MAC Address filtering** on your access point or router

Enable **encryption** on access point and change passphrase often

How to Defend Against Wireless Attacks (Cont'd)

Configuration
Best Practices

SSID Settings
Best Practices

Authentication
Best Practices

Use **SSID cloaking** to keep certain default wireless messages from broadcasting the ID to everyone

Do not use your SSID, company name, network name, or any **easy to guess** string in passphrases

Place a **firewall or packet filter** in between the AP and the corporate Intranet

Limit the **strength of the wireless network** so it cannot be detected outside the bounds of your organization

Check the wireless devices for **configuration or setup** problems regularly

Implement an additional technique for **encrypting traffic**, such as IPSEC over wireless

How to Defend Against Wireless Attacks (Cont'd)

Configuration Best Practices

Choose Wi-Fi Protected Access (**WPA**) instead of WEP

Implement **WPA2 Enterprise** wherever possible

Disable the **network** when not required

SSID Settings Best Practices

Place wireless access points in a **secured location**

Keep drivers on all wireless equipment **updated**

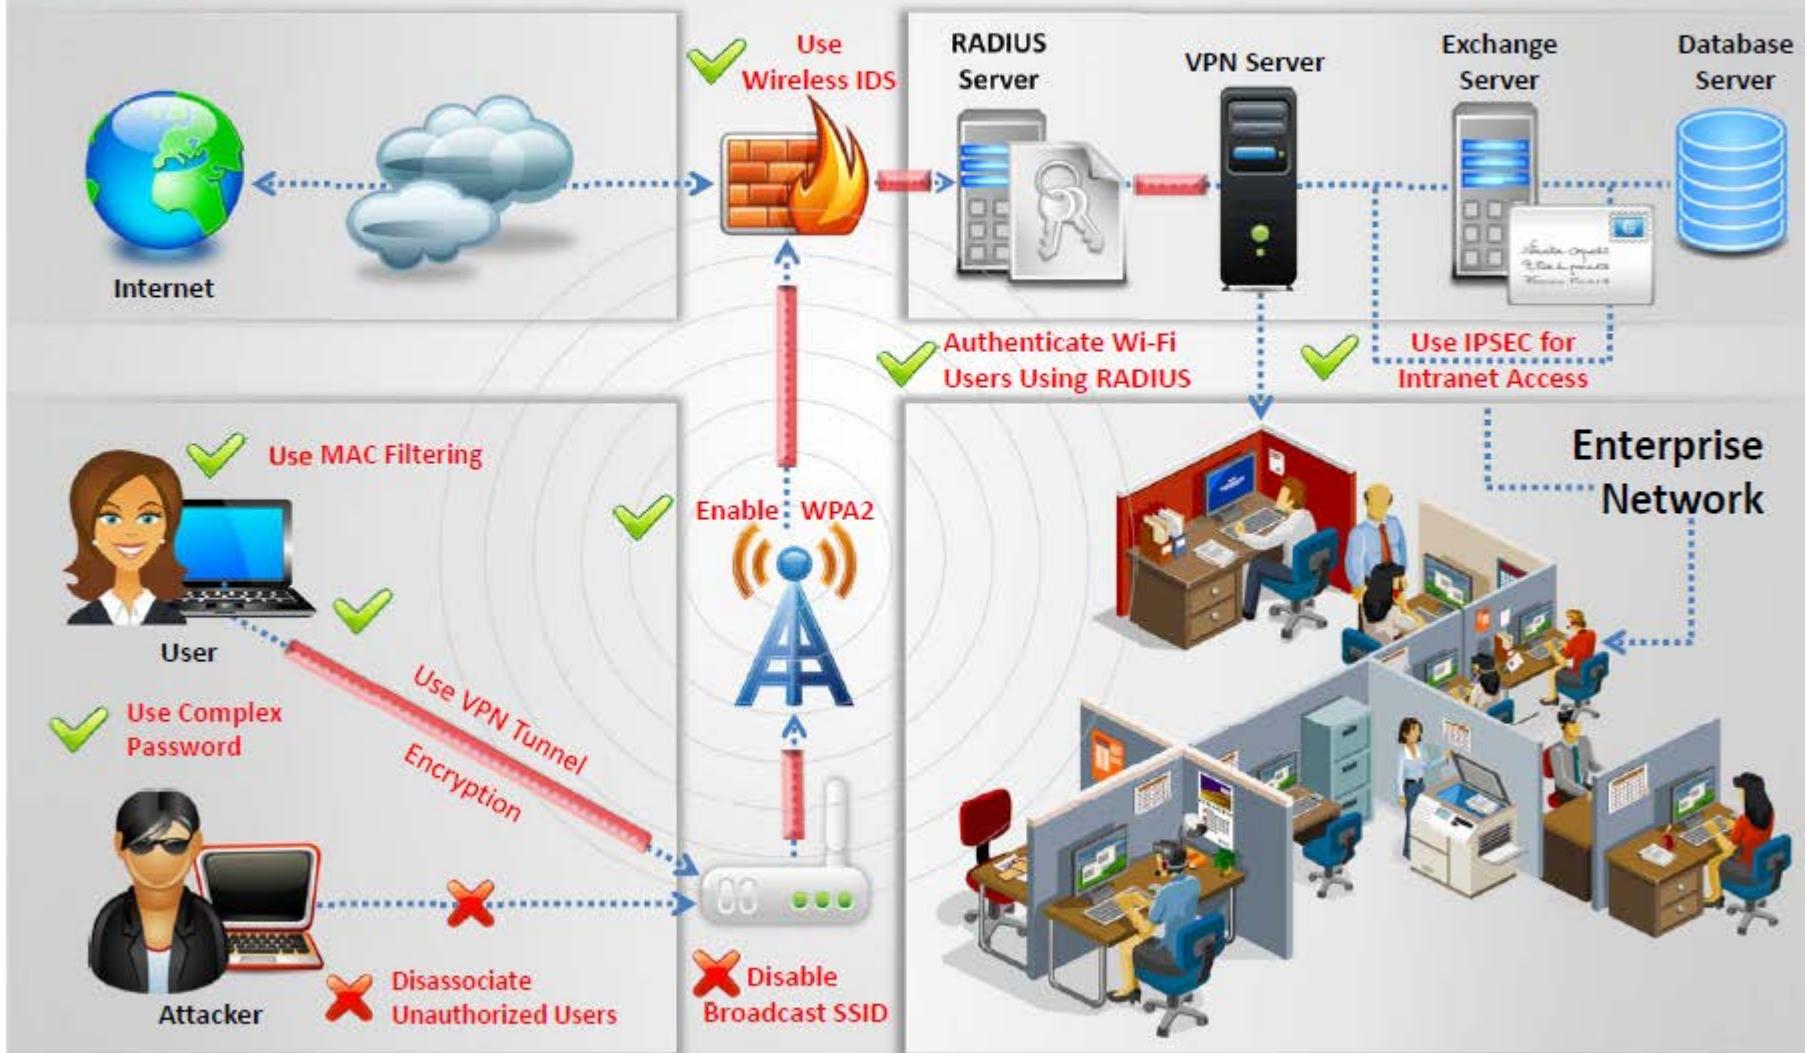

Use a centralized server for **authentication**

Wi-Fi Security Auditing Tool: AirMagnet WiFi Analyzer

C|EH
Certified Ethical Hacker

- It is a Wi-Fi networks **auditing** and **troubleshooting** tool
- Automatically **detects** **security threats** and other wireless network vulnerabilities
- It **detects Wi-Fi attacks** such as Denial of Service attacks, authentication/encryptions attacks, network penetration attacks, etc.
- It can **locate unauthorized (rogue) devices** or any policy violator

<http://www.flukenelements.com>

Wi-Fi Security Auditing Tool: Motorola's AirDefense Services Platform (ADSP)

C|EH
Certified Ethical Hacker

The screenshot shows the Motorola AirDefense Services Platform (ADSP) interface. At the top, there's a navigation bar with 'Menu', 'Dashboard' (which is selected), 'Network', 'Alarms', and 'Configuration'. Below the navigation is a toolbar with 'View Customization', 'Scope' set to 'AirDefense S...', and tabs for 'General', 'Security', 'Infrastructure', and 'Performance'. A sidebar on the left lists various dashboard components like 'Appliance Status', 'BSSs by Configuration', 'Device Table', etc. The main area features a large callout box with the heading 'What does AirDefense do?'. Inside the callout, a bulleted list details the platform's features:

- AirDefense provides single UI-based platform for **wireless monitoring, intrusion protection**, automated threat mitigation, etc.
- It provides tools for wireless **rogue detection**, policy enforcement, intrusion prevention and regulatory compliance
- It uses **distributed sensors** that work in tandem with a hardened purpose-built server appliance to **monitor all 802.11 (a/b/g/n) wireless traffic** in real-time
- It analyzes **existing and day-zero threats** in real-time against historical data to accurately detect all wireless attacks and anomalous behavior
- It enables the rewinding and reviewing of detailed wireless activity records that assist in **forensic investigations** and ensure policy compliance

Below the callout, there are two tables: 'Device Table' and 'Infrastructure Overview'.

Device Table		Infrastructure Overview			
		Unknown Devices	Name	Online	Compliance Failure
917		APs	APs	0	20
26		Wired Switches	Wired Switches	0	5
7		Wireless Switches	Wireless Swit...	0	5
5		Sensors	Sensors	4	0
6		Wireless Clients			2
1,298		BSSs			
1,624					

	Name	Online	Compliance Failure	Offline
APs	0	20	0	
Wired Switches	0	5	0	
Wireless Switches	0	5	0	
Sensors	4	0	2

Advanced Parameters: sanity-mse
Services > Mobility Services > System > Advanced Parameters

General Information	
Product Name	Cisco Mobility Service Engine
Version	4.0.42.0
Started At	2/14 1:49 PM
Current Server Time	2/14 9:54 AM
Timezone	America/Los_Angeles
Hardware Restarts	10
Active Sessions	1

Logging Options	
Logging Level	Trace
Core Engine	<input checked="" type="checkbox"/> Enable

Cisco UDE	
Product Identifier (PID)	AIR-MSE-3310-K9
Version Identified (VID)	V01
Serial Number (SN)	Not Specified

Advanced Parameters	
Advanced Debug	<input type="checkbox"/>
Number of Days to keep Events	2 1 - 99999
Session Timeout	30 1 - 99999 mins
Absent Data cleanup interval	1440 1 - 99999 mins

Advanced Commands	
Reboot Hardware	<input type="button" value="Reboot"/>
Shutdown Hardware	<input type="button" value="Shutdown"/>
Clear Configuration	<input type="button" value="Clear Configuration"/>
Clear Management Database	<input type="button" value="Clear Management Database"/>

http://www.cisco.com

- Adaptive Wireless IPS (WIPS) provides wireless-network **threat detection and mitigation** against malicious attacks and security vulnerabilities
- It provides the ability to **detect, analyze, and identify wireless threats**

Wi-Fi Security Auditing Tool: Aruba RFProtect

Integrated wireless **intrusion detection** and prevention

Automatic threat mitigation for centrally evaluating forensic data, and actively containing rogues and locking down device configuration

Automated compliance reporting to meet policy mandates for PCI, HIPAA, DoD 8100.2, and GLBA with automated report distribution that is tailored to specific audit requirements

Wireless Security Tools

Wi-Fi Pen Testing

Wireless Penetration Testing

- The process of actively **evaluating information security measures** implemented in a wireless network to analyze design weaknesses, technical flaws and vulnerabilities
- A comprehensive report in **detail about the findings** along with the suite of **recommended countermeasures** is delivered to the executive, management, and technical audiences

Threat Assessment

Identify the wireless threats facing an organization's information assets

Security Control Auditing

To test and validate the efficiency of wireless security protections and controls

Upgrading Infrastructure

Change or upgrade existing infrastructure of software, hardware, or network design

Data Theft Detection

Find streams of sensitive data by sniffing the traffic

Risk Prevention and Response

Provide comprehensive approach of preparation steps that can be taken to prevent inevitable exploitation

Information System Management

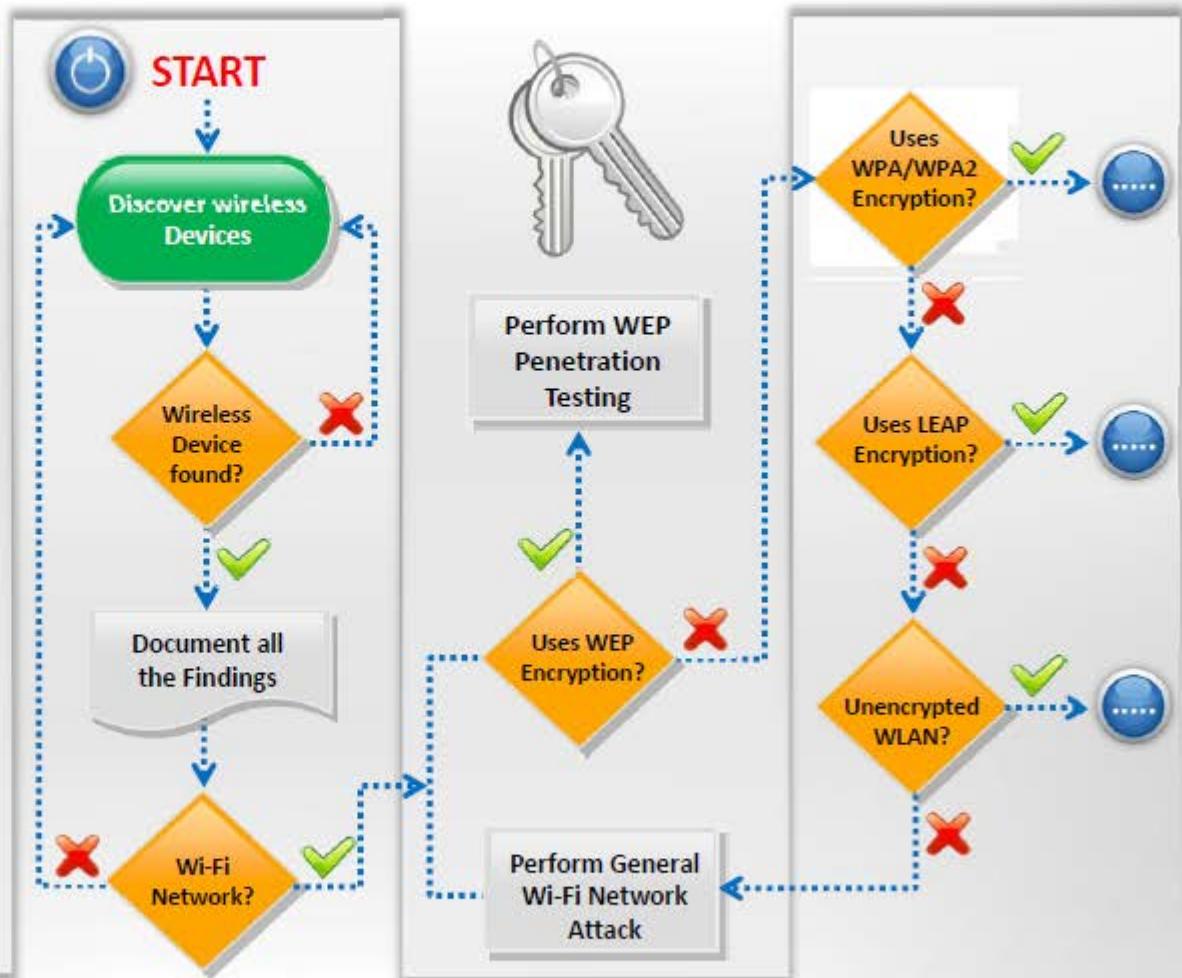

Collect information on security protocols, network strength and connected devices

Wireless Penetration Testing Framework

CEH
Certified Ethical Hacker

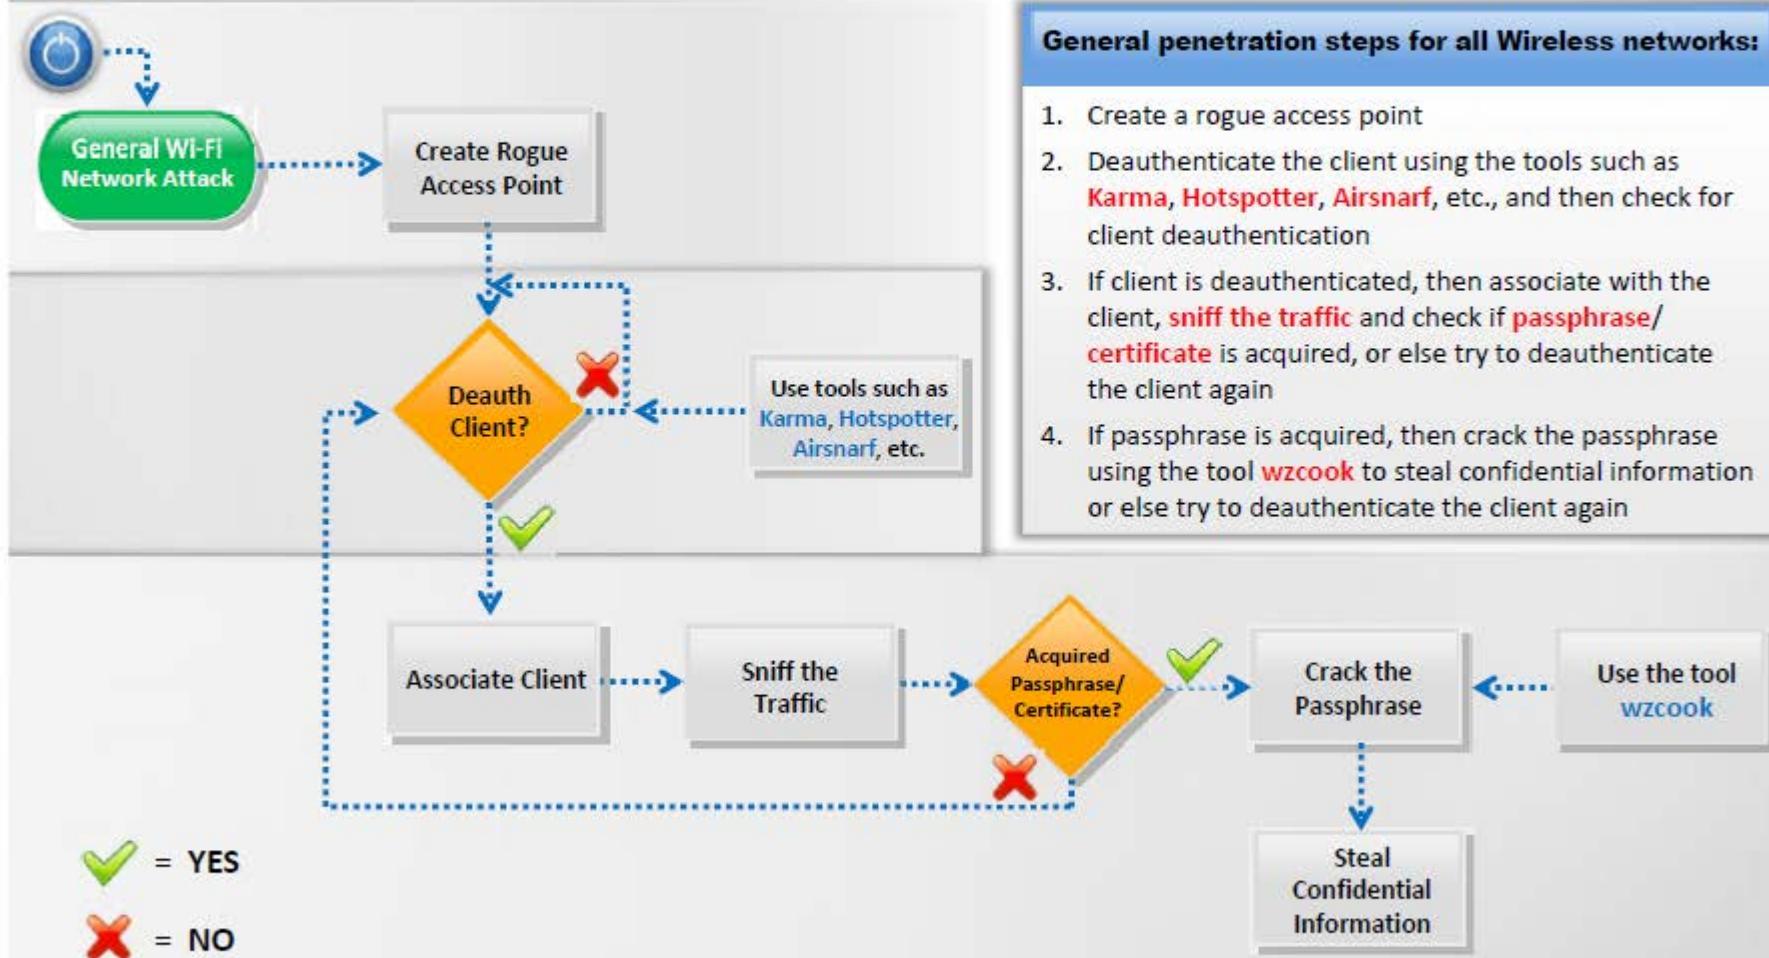

Wireless Pen Testing Framework

- Discover wireless devices
- If wireless device is found, document all the findings
- If the wireless device found using Wi-Fi network, then perform general Wi-Fi network attack and check if it uses WEP encryption
- If WLAN uses WEP encryption, then perform WEP encryption pen testing or else check if it uses WPA/WPA2 encryption
- If WLAN uses WPA/WPA2 encryption, then perform WPA/WPA2 encryption pen testing or else check if it uses LEAP encryption
- If WLAN uses LEAP encryption, then perform LEAP encryption pen testing or else check if WLAN is unencrypted
- If WLAN is unencrypted, then perform unencrypted WLAN pen testing or else perform general Wi-Fi network attack

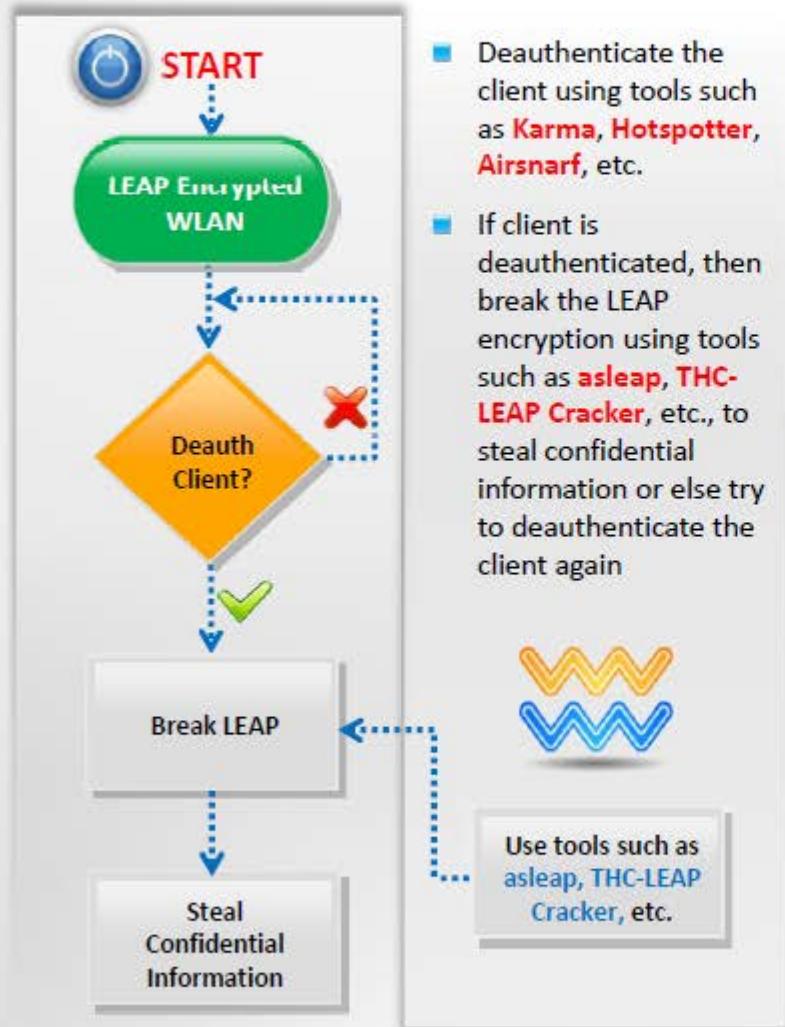

Wi-Fi Pen Testing Framework

CEH
Certified Ethical Hacker

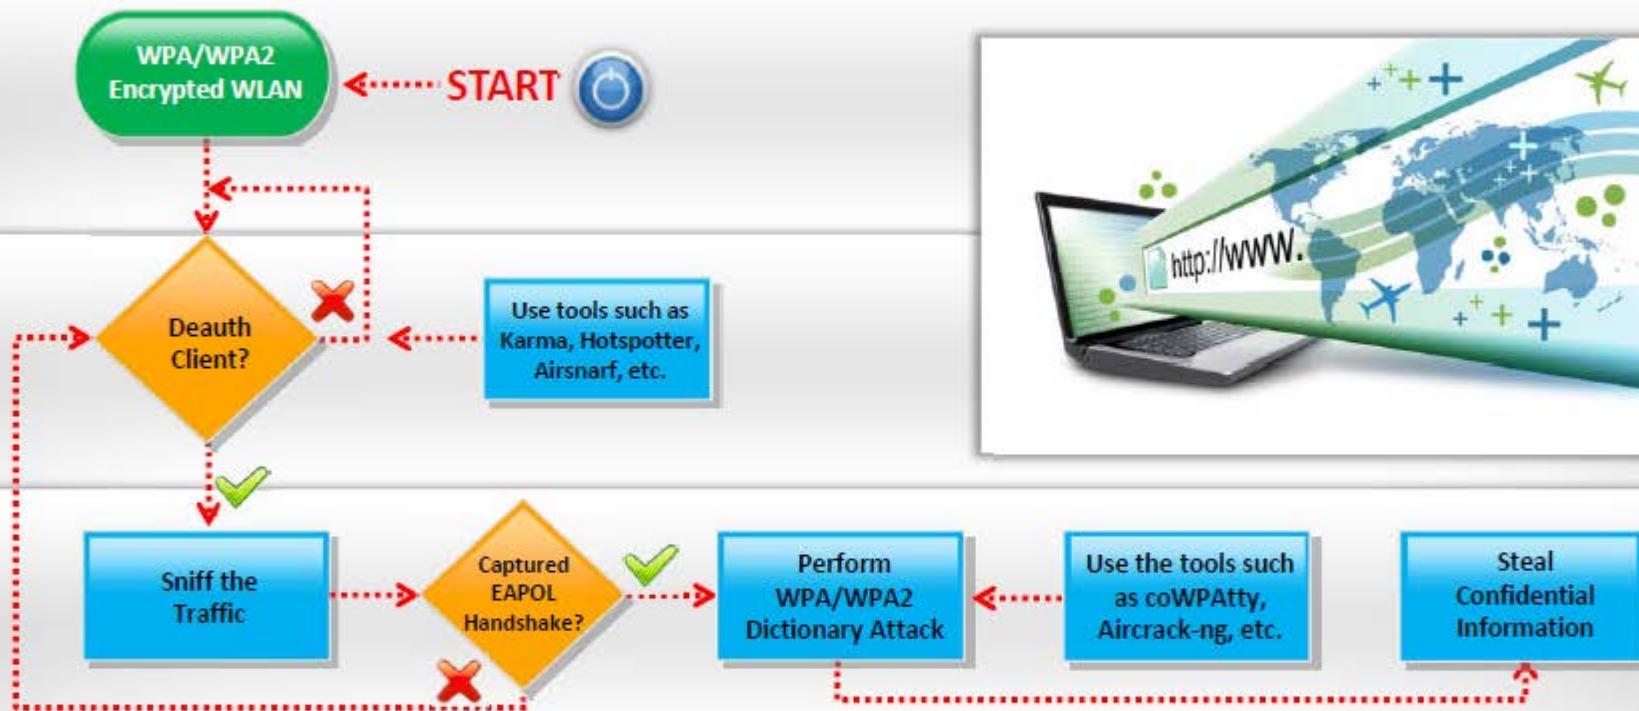

Pen Testing **LEAP** Encrypted WLAN

CEH
Certified Ethical Hacker

Pen Testing WPA/WPA2 Encrypted WLAN

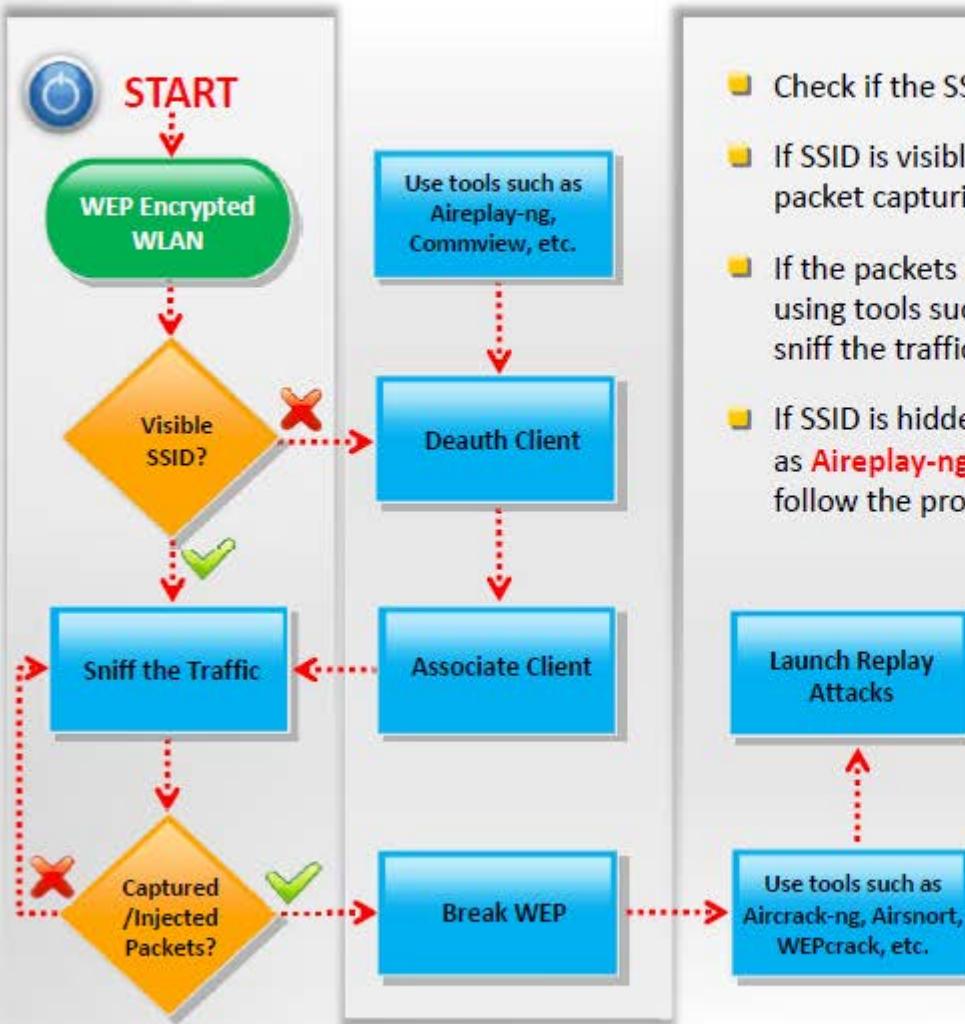

CEH
Certified Ethical Hacker

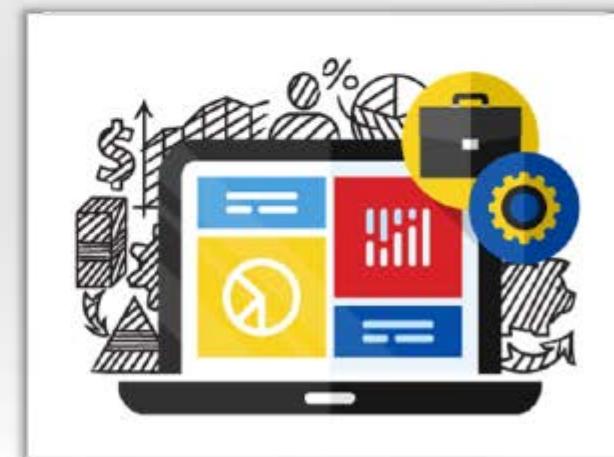

- Deauthenticate the client using tools such as **Karma**, **Hotspotter**, **Airsnarf**, etc.
- If client is deauthenticated, sniff the traffic and then check the status of capturing EAPOL handshake or else try to deauthenticate the client again
- If EAPOL handshake is captured, then perform PSK dictionary attack using tools such as **coWPAtty**, **Aircrack-ng**, etc. to steal confidential information or else try to deauthenticate the client again

Pen Testing WEP Encrypted WLAN

CEH
Certified Ethical Hacker

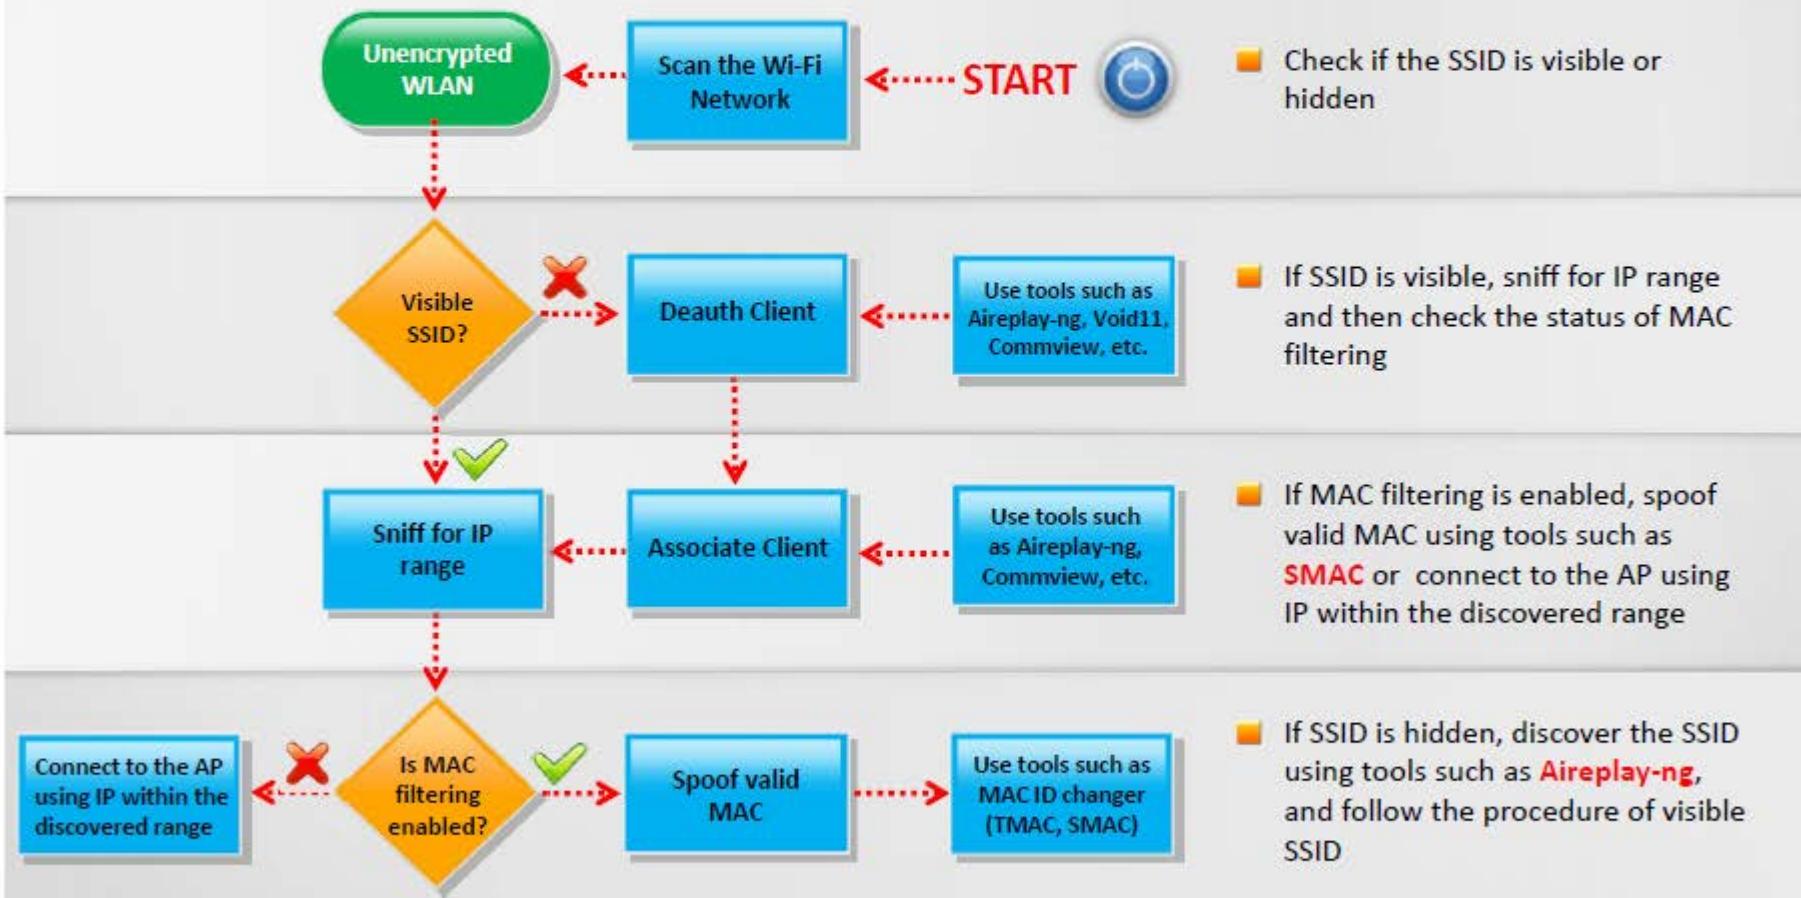

- Check if the SSID is visible or hidden
- If SSID is visible, sniff the traffic and then check the status of packet capturing
- If the packets are captured/injected, then break the WEP key using tools such as **Aircrack-ng**, **Airsnort**, **WEPcrack**, etc., or else sniff the traffic again
- If SSID is hidden, then deauthenticate the client using tools such as **Aireplay-ng**, **Commview**, etc., associate the client and then follow the procedure of visible SSID

Pen Testing Unencrypted WLAN

CEH
Certified Ethical Hacker

Module Summary

- ❑ IEEE 802.11 standards based Wi-Fi networks are widely used for communication and data transfer across a radio network
- ❑ A Wi-Fi infrastructure generally consists of hardware components such as wireless routers and APs, antennas, relay towers and authentication servers, and software components such as encryption algorithms, key management and distribution mechanisms
- ❑ Most widely used wireless encryption mechanisms include WEP, WPA and WPA2, of which, WPA2 is considered most secure
- ❑ WEP uses 24-bit initialization vector (IV) to form stream cipher RC4 for confidentiality, and the CRC-32 checksum for integrity of wireless transmission
- ❑ WPA uses TKIP which utilizes the RC4 stream cipher encryption with 128-bit keys and 64-bit keys for authentication whereas WPA2 encrypts the network traffic using a 256 bit key with AES encryption
- ❑ WEP is vulnerable to various analytical attack that recovers the key due to its weak IVs whereas WPA is vulnerable to password brute forcing attacks
- ❑ Wi-Fi networks are vulnerable to various access control, integrity, confidentiality, availability and authentication attacks
- ❑ Wi-Fi attack countermeasures include configuration best practices, SSID settings best practices, authentication best practices and wireless IDS systems
